EXHIBIT C

Mitigated Negative Declaration
(ENV-2022-4865-MND)
and Mitigation Monitoring Program
Oil and Gas Drilling Ordinance
Case Number: ENV-2022-4865-MND

**Project Location:** Citywide - Ordinance applicable within the boundaries of the City of Los Angeles, which encompasses approximately 465 square miles.

**Community Plan Area:** Citywide

**Council District:** Citywide

**Project Description:** The Project is a proposed Oil and Gas Drilling Ordinance (Oil Ordinance, Ordinance or Project) amending Sections 12.03, 12.20, 12.23, 12.24, and 13.01 of the Los Angeles Municipal Code (LAMC) to prohibit new oil and gas extraction and make existing extraction activities a nonconforming use in all zones within the City of Los Angeles (City). Specifically, the Ordinance amends the LAMC to (1) eliminate the provisions of the LAMC that allow for the creation of new “O” Oil Drilling Supplemental Use Districts; (2) end by-right oil and gas extraction in the M3-Heavy Industrial Zones; (3) declare existing oil and gas extraction within the City a nonconforming use to terminate within 20 years; and (4) prohibit new or expanded oil and gas extraction activities (such as the drilling of new wells or the redrilling or deepening of existing wells). The Ordinance permits maintenance of the wells that the Zoning Administrator determines is necessary to protect public health, safety or the environment. The Ordinance exempts from its requirements wells that are operated by a public utility that is regulated by the California Public Utilities Commission. Twenty years from the effective date of the Ordinance, all nonconforming non-exempt oil and gas extraction uses will terminate.

INITIAL STUDY

1 INTRODUCTION

This Initial Study (IS) document evaluates potential environmental effects resulting from the proposed Oil and Gas Drilling Ordinance amending the LAMC to prohibit new oil and gas extraction and make existing extraction activities a nonconforming use in all zones (Oil Ordinance or Ordinance or Project). The Project is subject to the guidelines and regulations of the California Environmental Quality Act (CEQA). Therefore, this document has been prepared in compliance with the relevant provisions of CEQA and the State CEQA Guidelines as implemented by the City of Los Angeles (City). Based on the analysis provided within this Initial Study, the City has concluded that the Project can be mitigated to a less than significant level, resulting in the preparation of a Mitigated Negative Declaration. This Initial Study and Mitigated Negative Declaration are intended as informational documents and are ultimately required to be adopted by the decision maker prior to project approval by the City.

1.1 PURPOSE OF AN INITIAL STUDY

CEQA was enacted in 1970 with several basic purposes: (1) to inform governmental decision makers and the public about the potential significant environmental effects of proposed projects; (2) to identify ways that environmental damage can be avoided or significantly reduced; (3) to prevent significant, avoidable damage to the environment by requiring changes in projects through the use of feasible alternatives or mitigation measures; and (4) to disclose to the public the reasons behind a project’s approval even if significant environmental effects are anticipated.

The City of Los Angeles is the lead agency for this Project. The Los Angeles City Council instructed the Department of City Planning (DCP) to prepare the Project. DCP has determined that the Project is subject to CEQA, and the preparation of an Initial Study is required.

An Initial Study is a preliminary analysis conducted by the Lead Agency, in consultation with other agencies (responsible or trustee agencies, as applicable), to determine whether there is substantial evidence that a project may have a significant effect on the environment. If the Initial Study concludes that the Project, even with mitigation, may have a significant effect on the environment, an Environmental Impact Report should be prepared; otherwise, the Lead Agency may adopt a Negative Declaration or a Mitigated Negative Declaration.
This Initial Study has been prepared in accordance with CEQA (Public Resources Code §21000 et seq.) and the State CEQA Guidelines (Title 14, California Code of Regulations, §15000 et seq.).

1.2 ORGANIZATION OF THE INITIAL STUDY

This Initial Study is organized into five sections as follows:

1. **Introduction**: Describes the purpose and content of the Initial Study and provides an overview of the CEQA process.

2. **Executive Summary**: Provides Project information, identifies key areas of environmental concern, and includes a determination whether the project may have a significant effect on the environment.

3. **Project Description**: Provides a description of the environmental setting and the Project, including project characteristics and a list of discretionary actions.

4. **Evaluation of Environmental Impacts**: Contains the completed Initial Study Checklist and discussion of the environmental factors that would be potentially affected by the Project.

5. **Conclusion**: Describes the overall findings of the Initial Study and recommends next steps.

1.3 CEQA PROCESS

In compliance with the State CEQA Guidelines, the City, as the Lead Agency for the Project, will provide opportunities for the public to participate in the environmental review process. As described below, throughout the CEQA process, an effort will be made to inform, contact, and solicit input on the Project from various government agencies and the general public, including stakeholders and other interested parties.

1.3.1 Initial Study Review Process

At the onset of the environmental review process, the City has prepared this Initial Study to determine if the Project may have a significant effect on the environment. This Initial Study determined that the Project does not have significant environmental impacts but will require mitigation measures to reduce impacts below a level of significance.

A Notice of Intent to Adopt a MND is provided to inform the general public, responsible agencies, trustee agencies, and the county clerk of the availability of the document and the locations where the document can be reviewed. A 30-day review period is identified to allow the public and agencies to review the document. The notice is mailed to any
interested parties and is noticed to the public through publication in a newspaper of general circulation.

The decision-making body then considers the MND, together with any comments received during the public-review process, and may adopt the MND and approve the project. In addition, when approving a project for which an MND has been prepared, the decision-making body must find that there is no substantial evidence that the project will have a significant effect on the environment, and that the MND reflects the lead agency’s independent judgment and analysis.

2.1 OTHER PUBLIC AGENCIES WHOSE APPROVAL IS REQUIRED
(e.g., permits, financing approval, or participation agreement)
None.

2.2 ENVIRONMENTAL FACTORS POTENTIALLY AFFECTED
The environmental factors checked below would be potentially affected by this project, involving at least one impact that is a “Potentially Significant Impact” as indicated by the checklist on the following pages.

☐ Aesthetics    ☐ Greenhouse Gas Emissions    ☐ Public Services
☐ Agriculture & Forestry Resources    ☐ Hazards & Hazardous Materials    ☐ Recreation
☐ Air Quality    ☐ Hydrology / Water Quality    ☐ Transportation
☐ Biological Resources    ☐ Land Use / Planning    ☐ Tribal Cultural Resources
☐ Cultural Resources    ☐ Mineral Resources    ☐ Utilities / Service Systems
☐ Energy    ☐ Noise    ☐ Wildfire
☐ Geology / Soils    ☐ Population / Housing    ☐ Mandatory Findings of Significance

2.3 DETERMINATION
(To be completed by the Lead Agency)
On the basis of this initial evaluation:

☐ I find that the proposed project COULD NOT have a significant effect on the environment, and a NEGATIVE DECLARATION will be prepared.
☒ I find that although the proposed project could have a significant effect on the environment, there will not be a significant effect in this case because revisions on the project have been made by or agreed to by the project proponent. A MITIGATED NEGATIVE DECLARATION will be prepared.

☐ I find the proposed project MAY have a significant effect on the environment, and an ENVIRONMENTAL IMPACT REPORT is required.

☐ I find the proposed project MAY have a “potentially significant impact” or “potentially significant unless mitigated” impact on the environment, but at least one effect 1) has been adequately analyzed in an earlier document pursuant to applicable legal standards, and 2) has been addressed by mitigation measures based on earlier analysis as described on attached sheets. An ENVIRONMENTAL IMPACT REPORT is required, but it must analyze only the effects that remain to be addressed.

☐ I find that although the proposed project could have a significant effect on the environment, because all potentially significant effects (a) have been analyzed adequately in an earlier EIR or NEGATIVE DECLARATION pursuant to applicable standards, and (b) have been avoided or mitigated pursuant to that earlier EIR or NEGATIVE DECLARATION, including revisions or mitigation measures that are imposed upon the proposed project, nothing further is required.

2.4 EVALUATION OF ENVIRONMENTAL IMPACTS

1) A brief explanation is required for all answers except "No Impact" answers that are adequately supported by the information sources a lead agency cites in the parentheses following each question. A "No Impact" answer is adequately supported if the referenced information sources show that the impact simply does not apply to projects like the one involved (e.g., the project falls outside a fault rupture zone). A "No Impact" answer should be explained where it is based on project-specific factors as well as general standards (e.g., the project will not expose sensitive receptors to pollutants, based on a project-specific screening analysis).

2) All answers must take account of the whole action involved, including off-site as well as on-site, cumulative as well as project-level, indirect as well as direct, and construction as well as operational impacts.

3) Once the lead agency has determined that a particular physical impact may occur, then the checklist answers must indicate whether the impact is potentially significant, less than significant with mitigation, or less than significant. "Potentially Significant Impact" is appropriate if there is substantial evidence that an effect may be significant. If there are one or more "Potentially Significant Impact" entries when the determination is made, an EIR is required.

4) "Negative Declaration: Less Than Significant With Mitigation Incorporated" applies where the incorporation of a mitigation measure has reduced an effect from "Potentially Significant Impact" to "Less Than Significant Impact." The lead agency must describe the mitigation measures, and briefly explain how they reduce the effect to a less than significant level (mitigation measures from "Earlier Analysis," as described in (5) below, may be cross referenced).

5) Earlier analysis must be used where, pursuant to the tiering, program EIR, or other CEQA process, an effect has been adequately analyzed in an earlier EIR, or negative declaration. Section 15063 (c)(3)(D). In this case, a brief discussion should identify the following:

6) Earlier Analysis Used. Identify and state where they are available for review.

   a) Impacts Adequately Addressed. Identify which effects from the above checklist were within the scope of and adequately analyzed in an earlier document pursuant to applicable legal standards, and state whether such effects were addressed by mitigation measures based on the earlier analysis.
b) Mitigation Measures. For effects that are "Less Than Significant With Mitigation Measures Incorporated," describe the mitigation measures which were incorporated or refined from the earlier document and the extent to which they address site-specific conditions for the project.

7) Lead agencies are encouraged to incorporate into the checklist references to information sources for potential impacts (e.g., general plans, zoning ordinances). Reference to a previously prepared or outside document should, where appropriate, include a reference to the page or pages where the statement is substantiated.

8) Supporting Information Sources: A sources list should be attached, and other sources used or individuals contacted should be cited in the discussion.

9) This is only a suggested form, and lead agencies are free to use different formats; however, lead agencies should normally address the questions from this checklist that are relevant to a project’s environmental effects in whichever format is selected.

10) The explanation of each issue should identify:

   a) The significance criteria or threshold, if any, used to evaluate each question; and

   b) The mitigation measure identified, if any, to reduce the impact to less than significance.
INITIAL STUDY

3 PROJECT DESCRIPTION

3.1 PROJECT SUMMARY

The Project is a proposed Oil and Gas Drilling Ordinance (Oil Ordinance or Ordinance or Project) amending Sections 12.03, 12.20, 12.23, 12.24, and 13.01 of the Los Angeles Municipal Code (LAMC) to prohibit new oil and gas extraction and make existing extraction activities a nonconforming use in all zones within the City of Los Angeles (City). Specifically, the Ordinance amends the LAMC to (1) eliminate the provisions of the LAMC that allow for the creation of new “O” Oil Drilling Supplemental Use Districts; (2) end by-right oil and gas extraction in the M3-Heavy Industrial Zones; (3) declare existing oil and gas extraction within the City a nonconforming use to terminate within 20 years; and (4) prohibit new or expanded oil and gas extraction activities (such as the drilling of new wells or the redrilling or deepening of existing wells). The Ordinance permits maintenance of the wells that the Zoning Administrator determines is necessary to protect public health, safety or the environment. The Ordinance exempts from its requirements wells that are operated by a public utility that is regulated by the California Public Utilities Commission. Twenty years from the effective date of the Ordinance, all nonconforming oil and gas extraction uses will terminate.

3.2 ENVIRONMENTAL SETTING

For the purpose of CEQA, the analysis of potential environmental impacts from a “project” is based upon a comparison of the potential impacts of a project with the baseline. The baseline is generally the existing conditions at the time the City commences the environmental review of the project (CEQA Guidelines Section 15125(a)). The Ordinance’s allowance for any maintenance of wells that the Zoning Administrator determines is necessary to protect public health, safety or the environment will not change existing conditions, as these activities currently take place within the existing regulatory setting. The following provides a summary of the existing oil and gas extraction operations in the City and the regulatory framework governing these operations based upon data and information currently available.

3.2.1 Regulatory Framework

In the City, drilling sites and associated infrastructure are regulated by a variety of local, state, and federal agencies, which have their own distinct environmental monitoring and enforcement requirements as they relate to oil operations. The following describes the
primary regulatory requirements governing oil and gas extraction activities and the agencies tasked with the oversight of oil operations within the City.

A. Federal Regulatory Agencies

United States Environmental Protection Agency (EPA)

EPA is an agency of the United States federal government responsible for creating standards and laws that promote the health of individuals and the environment. The EPA regulates the manufacturing, processing, distribution, and use of chemicals and other pollutants and is charged with determining safe tolerance levels for chemicals and other pollutants in food, animal feed, and water. The EPA also runs programs to prevent, control, and respond to oil spills, control air pollution and forecast air pollution levels, and foster the manufacture of more fuel-efficient vehicles. The EPA works to enforce laws such as the Clean Air Act, the Safe Drinking Water Act, the National Environmental Education Act, and the Clean Water Act (CWA).

The Comprehensive Environmental Response Compensation, and Liability Act (CERCLA or Superfund) authorizes EPA to respond to releases, or threatened releases, of hazardous substances that might endanger public health, welfare, or the environment. It also grants EPA the authority to force parties responsible for environmental contamination to clean it up or to reimburse response costs incurred by EPA.

The Resource Conservation and Recovery Act (RCRA) is the federal public law that creates the framework for the proper management of hazardous and non-hazardous solid waste through the authority of the EPA.

With regard to the CWA, spill prevention, control and countermeasures (SPCC) regulations are designed to protect our nation’s waters from oil pollution caused by oil spills that could reach the waters of the United States or adjoining shorelines. The section of the CWA regulations known as the “sheen rule” provides the framework for determining whether a facility or vessel responsible for an oil spill must report the spill to the federal government. The Oil Pollution Act (OPA) of 1990 amended the CWA, and provided new requirements for contingency planning by government and industry under the National Oil and Hazardous Substances Pollution Contingency Plan. OPA also increased penalties for regulatory non-compliance, broadened the response and enforcement authorities of the federal government, and preserved state authority to establish laws governing oil spill prevention and response.

Occupational Safety and Health Administration (OSHA)

The General Duty Clause of the OSH Act (the law that created OSHA) requires employers to provide workers with a safe workplace that does not have any recognized hazards that
cause or are likely to cause death or serious injury. Exposures to hazards present in the oil and gas well drilling, servicing, and storage industry are addressed in specific standards for general industry, including federal law 29 CFR 1926 for site preparation and 29 CFR 1910 for operations.

B. State Regulatory Agencies

California Geologic Energy Management Division (CalGEM)

CalGEM is one of five divisions that comprise the California Department of Conservation. CalGEM ensures the safe exploration and development of energy resources. It is the state agency responsible for issuance of well permits for production and injection wells, and oversees the drilling, operation, maintenance, and plugging and abandonment of oil, natural gas, and geothermal wells.

CalGEM responsibilities are detailed in Section 3000 of the California Public Resources Code and Title 14, Chapter 4 of the California Code of Regulations (CCR). These regulations address issues such as well spacing, blow-out prevention devices, casing requirements, plugging and abandonment of wells, maintenance of facilities and safety systems, fencing, inspection frequency, and reporting requirements. Section 1774 of Title 14 CCR Division 2, Chapter 4 specifies maintenance practices related to oil field facilities and pipelines.

California Air Resources Board (CARB)

CARB is the primary state agency responsible for actions to protect public health from the harmful effects of air pollution and developing programs and actions to fight climate change. CARB approves the regional Air Quality Management Plans for incorporation into the State Implementation Plan and is responsible for preparing those portions of the plan related to mobile source emissions. CARB implements the California Clean Air Act (CCAA) requirements, regulating emissions from motor vehicles and setting fuel standards. The CCAA established ambient air quality standards for ozone, PM10, PM2.5, CO, NO2, SO2, lead, visibility-reducing particles, sulfates, H2S, and vinyl chloride. California standards are generally more stringent than the national standards.

Department of Toxic Substances Control (DTSC)

DTSC is a department of the California Environmental Protection Agency (CalEPA). DTSC protects the public health of communities and the environment from toxic contamination left behind from past industrial and commercial activities through its brownfields and environmental remediation programs under RCRA and CERCLA/Superfund, among other laws governing the cleanup of contaminated land, water, and air.
California State Water Resources Control Board

The State Water Board is housed within state government and is part of the CalEPA, and is tasked with protecting water quality by setting statewide policy, coordinating and supporting the Regional Board efforts, and reviewing petitions that contest Regional Board actions. Together with the regional boards, the State Water Board is authorized to implement the federal CWA in California. The State Water Board oversees certain well stimulation activities. The State Water Board is the lead on crude oil facilities, such as oil drill sites, that merit investigation for water contamination and remediation.

C. Regional Regulatory Agencies

California Regional Water Quality Control Board

There are nine regional water control boards statewide. Each regional board makes critical water quality decisions for its region, including setting standards, issuing waste discharge requirements, determining compliance with those requirements, and taking appropriate enforcement actions. The State Water Board and regional water boards do not permit oil and gas wells, but regional water boards do regulate oil and gas waste discharge ponds.

South Coast Air Quality Management District (SCAQMD)

The SCAQMD is the air pollution control agency for all of Orange County and the urban portions of Los Angeles, Riverside, and San Bernardino counties. The agency is responsible for controlling emissions primarily from stationary sources of air pollution and developing and enforcing emission control rules and regulations in the South Coast Air Basin and portions of the Salton Sea Air Basin and Mojave Desert Air Basin. By statute, SCAQMD is required to adopt an air quality management plan (AQMP) demonstrating compliance with all federal and state ambient air quality standards for the areas under the jurisdiction of the SCAQMD. Furthermore, SCAQMD must adopt rules and regulations that carry out the AQMP. The AQMP is a regional blueprint for how SCAQMD will achieve air quality standards and healthful air. The 2016 AQMP contained multiple goals promoting reductions of criteria air pollutants, greenhouse gases, and toxic air contaminants (TACs).

The SCAQMD also regulates oil and gas production equipment such as oil wells, flares, micro-turbines, gas separators, and other facility processing equipment. Under SCAQMD Rule 1148.2 (2013) - “Notification and Reporting Requirements for Oil and Gas Well and Chemical Suppliers,” onshore oil and gas well operators and chemical suppliers are required to electronically submit to the SCAQMD various types of reports related to well drilling, well completion, and well reworks.
SCAQMD Rule 1166 outlines safety requirements for excavation and ground disturbance on industrial and hazardous sites. Operators are required to obtain a Rule 1166 permit and follow all requirements which include handling rules for underground storage tanks, treatment of soil contaminated with volatile organic compounds, and debris/dust mitigation of potentially contaminated property soil. Operators must have a valid Rule 1166 permit throughout the duration of well abandonment and site decommissioning.

D. Local Regulatory Bodies in the City of Los Angeles

*Department of City Planning*

DCP is responsible for preparing, maintaining, and implementing a General Plan for the development of the City. The General Plan consists of the Framework Element, which provides overall guidance for the future of the City and other citywide elements including those that are State-mandated, including the Circulation, Noise, Housing, Open Space, Land Use, Conservation, and Safety elements.

DCP is also responsible for implementing the zoning code, which references oil and gas drilling and other related activities in LAMC Sections 12.03, 12.20, 12.23, 12.24, and 13.01.

*Fire Department*

The Los Angeles Fire Department (LAFD) is designated by the state of California as a Certified Unified Program Agency (CUPA) and is authorized to apply statewide standards to each facility within its jurisdiction that treats on site or generates hazardous waste, operates underground storage tanks, or stores hazardous materials. The LAFD Fire Prevention Bureau issues two types of permits to oil and gas well operators, including 1) a Division 4 Permit, an operational permit required to engage in the operation of an oil well and 2) an action permit for the drilling, re-drilling, or abandonment of an oil well.

*Department of Building and Safety*

The Los Angeles Department of Building and Safety (LADBS) provides permitting, plan check, inspection, and code enforcement services for residential and commercial buildings in the City. LADBS conducts inspections of oil and gas drill sites to ensure that construction and renovation work are completed properly. LADBS also enforces the required operating conditions for each established drill site.

*Bureau of Sanitation, Watershed Protection Division*

The City’s Bureau of Sanitation, Watershed Protection Division (WPD) implements the Watershed Protection Program, which is intended to protect the beneficial uses of
receiving waters while complying with all flood control and pollution abandonment mandates. WPD enforces the City’s Stormwater and Urban Runoff Pollution Control ordinance (LAMC Section 64.70) and responds to oil spills and environmental emergency events.

Los Angeles Department of Water and Power

The Los Angeles Department of Water and Power’s (LADWP) oil and gas well oversight relates to groundwater and potential groundwater contamination. LADWP reviews and inspects methods regarding the drilling, production operations, and disposal of waste and can intervene to require changes when merited for the full protection of the public water supply (see LAMC 13.01).

Board of Public Works

The Petroleum Administrator serves as the Director of the City's Office of Petroleum and Natural Gas Administration and Safety Office under the Board of Public Works. Los Angeles Administrative Code (LAAC) Sections 19.48-19.50 address the duties of the Director with respect to the management of petroleum matters affecting the City. These include, but are not limited to, addressing all matters related directly or indirectly to petroleum exploration and production and any matters concerning the creation of oil well drilling districts under the LAMC. Sections 19.53-19.71 address duties including referrals, investigations of applications, consultation with experts, recommendations to decision makers, publications, conditions, award of leases or agreements, execution of leases, sureties, forfeitures, and reservations (subject to the State Lands Commission). The Petroleum Administrator is also responsible for the oversight of the City’s pipeline franchise agreements.

3.2.2 Project Location

The Project is a citywide code amendment. The City has an approximate land area of 465 square miles (297,600 acres) with an estimated population of nearly 4.0 million residents (3,898,747), according to the 2020 Census. The City lies within Los Angeles County which encompasses 4,000 square miles, 88 incorporated cities, and more than 10 million residents (10,014,009), according to the 2020 Census. The City is divided into 15 Council Districts and 35 Community Plan Areas. More than 87 percent of the City is developed with urban uses.

3.2.3 Existing Conditions

According to August 2022 data from CalGEM, the City has 26 oil and gas fields that intersect City boundaries and 5,273 oil and gas wells. There are approximately 641 active,
1,350 idle, 35 canceled, and 3,247 plugged wells. Of the City’s idle wells, as of July 2022, 56 are orphan wells deemed likely to have no responsible solvent operator. There are oil and gas facilities in nearly every section of the City. See Figure 1, Oil Well Locations Within the City, and Table 1, Oil Wells By Council District. While some wells are situated in heavy industrial areas, others are located within residential neighborhoods and near community parks and schools. Much of the existing oil drilling and extraction is within underserved communities throughout the City. Table 2, Oil Fields Within the City, itemizes oil fields beneath the City, their time of discovery, and current status.

---

1 An active well is an oil well that has been drilled and completed, an idle well is inactive and not producing, but capable of being reactivated, a canceled well is one where a well permit was canceled prior to drilling, and a plugged well has been plugged and sealed to current standards.

2 There are two gas storage fields within the City, the Aliso Canyon and the Playa Del Rey Fields, which are both operated by the Southern California Gas Company (SoCalGas). SoCalGas is the primary operator of underground natural gas fields, natural gas storage wells, and natural gas transmission facilities within the City. No natural gas wells operated by public utilities would be impacted by the Ordinance.

* The Aliso Canyon and Playa Del Rey sites are former oil fields that are now gas storage facilities operated by the Southern California Gas Company and are not affected by the Project.

Source: City of Los Angeles, Office of Petroleum and Natural Gas Administration & Safety, Council File No. 17-0447 - Feasibility of Amending Current City Land Use Codes in Connection with Health Impacts at Oil and Gas Wells and Drill Sites, July 29, 2019.
As shown in Table 3, Oil & Gas Drill Sites, there are 17 drill sites (sites where multiple wells are concentrated) throughout the City where oil and gas operations occur. There are also nine abandoned drill sites in the City. As of 2019, approximately 67 percent of oil and gas wells are within drill sites. The remaining wells are dispersed throughout the City in urban and rural locations.

Source: City of Los Angeles, Department of City Planning and CalGEM, August 2022.

City of Los Angeles, Office of Petroleum and Natural Gas Administration & Safety, Council File No. 17-0447 - Feasibility of Amending Current City Land Use Codes in Connection with Health Impacts at Oil and Gas Wells and Drill Sites, July 29, 2019.
Wells are found in nearly all parts of the City, including, but not limited to, the communities of Wilmington, Harbor Gateway, Downtown, West Los Angeles, South Los Angeles, and the Northeast San Fernando Valley. While some wells are situated in heavy industrial areas, others are located in neighborhoods within close proximity to residences, schools, and other sensitive uses. Based upon information currently available to the City, approximately 1,410 wells are within 50 feet and 2,112 wells are within 100 feet of sensitive land uses identified as residences, schools, parks, daycares, nursing homes, or hospitals. For a list of sensitive receptors located in proximity to wells throughout the City, please refer to the Air Quality & Greenhouse Gas Technical Report (Appendix A to this Initial Study) and the Noise & Vibration Technical Report (Appendix B to this Initial Study).

In 2017, the average daily crude oil production rate from within the City was estimated to be 7,600 to 8,000 barrels of oil per day (BOPD). The standard volumetric measurement of a barrel of crude oil is forty-two (42) gallons. The annual cumulative oil production in 2017 was equivalent to 2.5 million barrels (bbl) of oil. Oil and gas production in the City represents approximately two percent of the state’s total production.

3.3 DESCRIPTION OF PROJECT

3.3.1 Project Background & Overview

The Los Angeles geological basin has one of the highest concentrations of crude oil per acre in the world. There are thousands of feet of oil-bearing sandstone rock formations underlying the City and the surrounding areas in Orange and Los Angeles Counties. In 1892, Edward Doheny and Charles Canfield drilled the first successful oil well in the Los Angeles City Oil Field (modern day Echo Park). Their discovery set off a series of major oil discoveries in the early 1900s and led to the City’s first major population boom.

By the 1930s, California was producing nearly one-quarter of the world’s oil output. Oil extraction activities played a key part in Los Angeles’ industrialization and growth over the ensuing decades. Today, Los Angeles is one of the largest urban oil fields in the

---

7 City of Los Angeles, Office of Petroleum and Natural Gas Administration & Safety, Council File No. 17-0447 - Feasibility of Amending Current City Land Use Codes in Connection with Health Impacts at Oil and Gas Wells and Drill Sites, July 29, 2019.
country, with drill sites and oil wells found in nearly all parts of the City, including, but not limited to, the communities of Wilmington, Harbor Gateway, Downtown, West Los Angeles, South Los Angeles, and the Northeast San Fernando Valley.

Oil and natural gas extraction is known as an upstream process because it includes the extraction and initial separation of oil, water and natural gas from hydrocarbon formations, but not the subsequent transportation, processing and storage (midstream) or the refining of petroleum or marketing and use of petroleum products (downstream). An upstream oil and natural gas producer sells the oil from the field where it is produced to a midstream pipeline company which transports oil and natural gas to downstream companies that operate refineries (or natural gas to utilities to operate power plants, and to natural gas storage and distribution facilities). These different activities are conducted by specialized companies and governed by sector-specific regulations. Upstream oil and natural gas extraction is thus distinct in terms of both operations and regulations from midstream pipeline companies, downstream refining and marketing companies and utilities that operate natural gas storage facilities and power plants that sell natural gas and electricity. The activities addressed by the ordinance are limited to upstream activities.

Petroleum production in most fields in the City and most of the Los Angeles Basin has several natural characteristics that are distinct to each field’s specific geometry, depth, sulfur content and production volume. Oil and natural gas wells in the City are distinguished by their low pressures and low flow rates. These facilities also typically hold small fluid volumes, since the oil is generally sent directly by pipeline to local refineries. In addition, the gas-to-oil ratio\(^8\) is very low in the Los Angeles Basin, which means that it is typically less volatile and generates lower air emissions of methane and volatile organic compounds. The water to oil ratio\(^9\) is very high in Los Angeles, which means that the vast majority of the fluid produced is water rather than oil or gas. After the oil is separated, the water is either disposed of via a local sanitation district or re-injected into the subsurface formation.

Although oil production was a defining feature of Los Angeles’ early development, this is no longer the case. The need to prioritize Angelenos’ health and safety and keep up with national and statewide efforts to become energy efficient and independent led to a 2017 motion (CF-17-0447)\(^10\) to the Council. The motion directed DCP, with the assistance of the City Attorney and the Petroleum Administrator, to provide a comprehensive analysis regarding possible implementation of changes to the City’s land use codes relative to oil and gas development. The motion included consideration of no oil or gas wells to be

---

8 The gas to oil ratio is a measure of the natural gas content in the produced fluid form the formation
9 The water to oil ratio is a measure of the water content in the production fluid.
located within a certain setback from sensitive uses, essentially by making those wells nonconforming uses. Secondarily, the motion included a directive to prepare an amortization period to determine the way nonconforming wells could be phased out of operation. The purpose of the motion was to address health risk concern associated with oil and gas development within urban areas, with the concern that the closer oil and gas wells are to sensitive uses, the higher the risk.

The Board of Public Works issued a report on July 29, 2019, regarding the feasibility of amending the current land use codes for oil wells and drill sites. The report largely focused on creating setbacks from sensitive uses. On December 20, 2020, the item was heard before the Energy, Climate Change, and Environmental Justice (ECCEJ) Committee. The Committee introduced a modified approach that would instead make all neighborhood oil and gas drilling in the City a nonconforming use, regardless of the proximity to sensitive receptors. On April 20, 2021, the Planning and Land Use Management (PLUM) Committee considered and concurred with ECCEJ’s recommendations and added additional instructions to the initial recommendations. Several of the instructions were referred to DCP and the Office of Petroleum and Natural Gas Administration and Safety (OPNGAS) to report back with a comprehensive analysis regarding the possible changes to the City’s land use codes relative to oil and gas development as well as to report on the necessary budget and staff needs to further address oil wells in urban residential neighborhoods in the City. The Committee emphasized the need to address health impacts from oil and gas drilling on disadvantaged neighborhoods.

After the motion was heard in Budget and Finance, on January 26, 2022,\textsuperscript{11} the City Council directed DCP, with the assistance of City Attorney, to prepare and present an ordinance to prohibit new oil and gas extraction and make extraction activities a nonconforming use in all zones. Pursuant to the City Council directive, DCP drafted a proposed citywide ordinance that would prohibit new oil and gas extraction and make existing extraction activities a nonconforming use in all zones.

At the direction of City Council, the City’s Petroleum Administrator and OPNGAS conducted an extensive inventory of oil and gas facilities within the City, participated in public hearings, collected historical records from multiple private and public databases, synthesized thousands of pages of technical reports, and retained a consultant to study the potential health impacts of oil and gas wells and drill sites within the City. The findings of the report, which are in CF17-0447, show that activities related to oil and gas operations have been associated with many potential negative health and safety impacts, especially when they occur in close proximity to sensitive uses, such as residences, schools, or

parks.\textsuperscript{12} Consistent with the City’s policies on climate change (i.e., L.A.’s Green New Deal, Sustainable City pLAn,\textsuperscript{13} and the City’s Health, Wellness and Equity Element of the General Plan “Plan for a Healthy Los Angeles”\textsuperscript{14}), Los Angeles is introducing regulations that would phase out oil activities altogether. Many of these plans and policies encourage reduction in oil usage, generation of green energy, expansion of electrical infrastructure and acknowledgement of environmental justice issues. \textbf{Table 4, City Policies Supporting the Oil and Gas Ordinance}, and \textbf{Table 5, Regional and State Policies Supporting the Oil and Gas Ordinance}, provide a summary of policies with which the Project is consistent. Polices are generally grouped according to CEQA topic area.

</table>

**Land Use and Planning**

**West Adams-Baldwin Hills-Leimert Community Plan**
- LU65-2 Capitalize on Emerging Industrial Sectors. Capitalize on rehabilitation and adaptive reuse of existing structures, as well as the introduction of contextual new infill construction in areas such as the Hyde Park Industrial Corridor. Provide land use incentives and standards that facilitate the generation of high wage jobs and training for the community especially within the growing “clean-tech” and “greentech” sectors. (P13, P33, P286)

**Wilmington Harbor City Community Plan**
- 1-6.1 The enlargement of nonconforming, incompatible commercial and industrial uses within areas designated on the Plan map for residential land use shall be prohibited, and action shall be taken toward their removal on a scheduled basis in conformance with Section 12.23 of the Municipal Code.
- 3-5.4 Seek the consolidation of surface oil extraction operations to free land for other uses, where feasible, to increase compatibility between oil operations and other land uses

**L.A.’s Green New Deal**
- Evaluate the feasibility of a no drill health and safety buffer zone between oil and gas production facilities and communities

**Mineral Resources**

**West Adams-Baldwin Hills-Leimert Community Plan**
- LU75-1 Discretionary Review. Seek a high level of discretionary review for any changes to, or expansion of, existing oil extraction sites and activities so that the public may remain informed and involved, and so that appropriate environmental review may take place pursuant to the California Environmental Quality Act.
- 3-5.3 Require, after January 1, 2000, that all drilling sites and oil production activities comply with the rules and regulations pertaining to urbanized areas. Alternatively, in the case of drilling sites and other oil production activities within a previously established drilling district, such sites and activities shall comply by January 1, 2000 with an Ordinance to be initiated which will (a) govern the maintenance and landscaping of drilling sites and other oil production activities; and (b) provide a program for the abandonment of drilling sites that no longer serve a useful function.

**Conservation Element**
- Policy 2: continue to support state and federal bans on drilling in the Santa Monica Bay and on new drilling along the California coast in order to protect the San Pedro and Santa Monica bays from potential spills associated with drilling, extraction and transport operations.

**L.A.’s Green New Deal**
- Reduce oil production by 40% below 2013 levels
- Coordinate with L.A. County to develop a sunset strategy for oil and gas production operations countywide
- Evaluate waste to energy technologies and conversion technology pilot projects to replace flares at oil drill sites; e.g., Micro Turbines
Develop an inter-agency Task Force to update City processes for inspections and permitting of oil and gas extraction facilities
Reduce oil production by 40% below 2013 levels
Coordinate with L.A. County to develop a sunset strategy for oil and gas production operations countywide
Develop an auditing and tracking program for oil and gas wells throughout the City

**Transportation**

**West Adams-Baldwin Hills-Leimert Community Plan**

- M12-3 Priority Parking for Alternative Fuel Vehicles. Encourage new commercial and retail developments to provide prioritized parking for shared vehicles, electric vehicles and vehicles using alternative fuels. (P209)

**Harbor Gateway Community Plan**

- M12-4 Connections for Electric Vehicles. Encourage new construction to include vehicle access to properly wired outdoor receptacles to accommodate zero emission vehicles and plug-in electric hybrids. (P109)

**Wilmington Harbor City Community Plan**

- 1-2.1 Locate higher residential densities near commercial centers and major transit routes, where public service facilities, utilities, and topography will accommodate this development.

**Safety Element**

- 1.2.7 Zero Emissions Vehicles. In keeping with the Mobility Plan, work toward zero emissions transportation and goods movement and increase zero emissions infrastructure including charging.

**L.A.’s Green New Deal**

- Support development of cleaner rail transport, including investigating the feasibility of rail electrification
- Implement an updated Clean Truck Program with prioritization of zero emission trucks
- Ensure that municipally deployed EV chargers are distributed equitably around the city, with a focus on underserved and disadvantaged neighborhoods
- Update the Transportation Demand Management (TDM) ordinance
- Distribute 1,000 used electric vehicle (EV) rebates, 11,500 Level 2 EV charger rebates, and 75 DC fast charger rebates
- Develop roadmap for Fossil Fuel Free Zone by 2021; and implement by 2030
- 100% Zero Emission school buses in Los Angeles
- 100% of urban delivery vehicles are zero emission
- Electrify LA Metro’s Orange and Silver Lines
- Electrify 100% of paratransit shuttle buses
- Expand the use of shore power (AMP) or other emissions capturing technologies to 100% of ships as part of a suite of emissions reductions programs for ocean going vessels
- 100% zero emission cargo handling equipment
- 100% zero emissions on-road drayage trucks

| 2022 CARB Scoping Plan | Generate clean electricity |

## Proposed Project

The Project is a proposed ordinance amending Sections 12.03, 12.20, 12.23, 12.24, and 13.01 of the Los Angeles Municipal Code (LAMC) to (1) eliminate the provisions of the LAMC that allow for the creation of new “O” Oil Drilling Supplemental Use Districts; (2) end by-right oil and gas extraction in the M3-Heavy Industrial Zones; (3) declare existing oil and gas extraction within the City a nonconforming use to terminate within 20 years; and (4) prohibit new or expanded oil and gas extraction activities (such as the drilling of new wells or the redrilling or deepening of existing wells). The Ordinance permits maintenance of the wells that the Zoning Administrator determines is necessary to protect public health, safety or the environment. Twenty years from the effective date of the Ordinance, all nonconforming oil and gas extraction uses will terminate.

This Ordinance is not applicable to (1) common carrier oil pipelines intended for regionally-coordinated transport of hydrocarbons; (2) service stations or like uses; (3) refineries; and (4) oil and injection wells that are verified to be plugged and abandoned in accordance with all applicable local, state, and federal laws, rules and regulations, including the California Statutes and Regulations overseen by the California Geologic Energy Management division (CalGEM), and LAFD and for which the well pad has been restored suitably for its subsequent use, and (5) any well operated by a public utility.
regulated by the California Public Utilities Commission, including those operating at the Aliso Canyon and Playa Del Rey Gas Storage Fields.

The Ordinance does not set a specific timetable for the closure and abandonment of wells, regulate the abandonment of oil wells that have permanently ceased operation, or mandate or regulate the remediation of well sites where extraction has terminated permanently.15

3.3.2 Analysis & Assumptions

The Ordinance will make existing oil and gas drilling operations legally nonconforming uses in the City, subject to a 20-year amortization period. Existing oil and gas extraction activities may continue to operate until the end of the amortization period after which time all drilling-related activities must cease. After a well ceases operation, current regulations require that the well be abandoned and plugged. However, the current regulations do not establish a set time period by which the abandonment process must be completed after a well ceases operation. As stated above, the Ordinance does not regulate abandonment when well operations permanently cease.

Currently it is unknown as to how many oil wells will permanently cease operations prior to the 20 year expiration date. This is because the time period that each of the City's approximately 1,991 active and idle wells will permanently cease extraction and undergo abandonment depends on a number of individual factors. For example, once the Ordinance becomes effective, some operators may choose to conclude operations immediately, others. may continue to operate until the end of the 20-year amortization period. However, once a well permanently ceases operation, there is a financial and economic incentive for the oil well operator to complete the abandonment process to reduce the costs of maintaining the well site. Therefore, because there is no reasonable way to accurately predict the timeline for cessation and abandonment at the individual level, this analysis instead assumes all oil drilling will cease 20 years from the effective date of the Ordinance as required. Abandonment of individual wells may occur at any time during the 20-year timeframe, and potentially beyond the 20-year timeframe.

Although not regulated by the Ordinance, well abandonment is a reasonably foreseeable outcome for many of the wells currently operating in the City, although as stated above, no specific timeline for abandonment currently exists and the Ordinance does not include any regulations related to the timing of the abandonment of oil wells. When a well

15 Public Resources Code Section 21000 requires that a lead agency identify all feasible mitigation measures that will avoid or substantially lessen the significant environmental effects of the project. This MND identifies areas of potentially significant impacts that would occur as a result of abandonment activities (See Noise, Hazards, Geology and Soils). In accordance with CEQA, mitigation measures are proposed where such impacts could be reduced to less than significant by their imposition.
permanently stops operating, termination and abandonment activities will generally include (1) the cessation of production and drilling operations; (2) the closure and plugging of all oil and gas wells, including water flooding injection wells, except injection wells as permitted and demonstrated to be active and necessary by CalGEM; and (3) the plugging/capping of subsurface pipelines. Neither implementation of the Ordinance nor the oil well abandonment process should require excavation of previously undisturbed land and no new permanent structures would be constructed as part of the Project.

Termination activities of nonconforming oil and gas extraction must adhere to all applicable local, state, and federal laws, regulations, rules and standards, including the California Statutes and Regulations and all other requirements overseen by CalGEM as the principal regulatory authority for the closure of oil and gas extraction and production sites. Termination and abandonment activities will occur within previously disturbed and developed areas of the properties that encompass oil and gas extraction activities. In some cases, new access points may be necessary to allow for ingress/egress of equipment necessary to complete the abandonment of wells. However, no new permanent roads or permanent changes to existing roads would be necessary as part of the Project.

The closure of oil and gas wells entails plugging the wells in place in accordance with California Statutes and Regulations and all other applicable requirements as overseen by CalGEM. The process of well abandonment will be determined on a case-by-case basis under the regulatory supervision of CalGEM and the LAFD and will depend on individual site conditions such as type and depth of well. However, for the purposes of this environmental analysis, several generalized assumptions have been made based upon standard industry practice, existing regulations governing well abandonment, and case studies. While plugging and abandonment varies by well, there is a consistent set of procedures that are followed. Generally, the drill site’s existing drilling or maintenance rig will be used to abandon the well and remove equipment from the well.\textsuperscript{16} Well equipment will be removed from the site by truck. Cement trucks will also arrive onsite to fill the well at various depths over a span of several days. An operator may use in excess of 2,500 cubic feet of cement for one abandonment. The process entails removing equipment and filling the well with cement at different phases in order to ensure that it is safe to abandon the well at varying depths. At the end of each work day, the well site is closed and the rig is shut down in order to resume operations the following work day. CalGEM conducts inspections at certain milestones for this scope of work, including the following:

\textsuperscript{16} When a drilling or maintenance rig is not already on the well site, a rig will need to be brought to the site to complete the abandonment process.
• Operators conduct a series of pressure tests on the wells to identify that there are no leaks or that the pressure is unsafe to work on the well. A test to measure any levels of hydrogen sulfide is common.

• Operators use a drilling or maintenance rig to work on the well and prepare blowout prevention equipment for the well that will be plugged.

• CalGEM inspects the blowout prevention equipment to ensure that it is safe for the operator to continue with plugging and abandonment work.

• Operators use the rig to pull out various cables, tubing, and other connections from the well casing.

• Operators may require the use of brine water to clean out different segments of the well. If no debris or sand is observed, then the operators continue using the rig to remove cables, tubing, and more connections from the well.

• After the operator has removed the sufficient amount of tubings, casing, and connections and there are minimal amounts of debris observed, then the operator will bring a cement truck to begin pouring fresh water and cement mix down the well. CalGEM is required to observe this first segment of pouring as the inspector is looking to observe that the bottom hole is filled with the appropriate amount of cement.

• The operator continues to remove casings and tubings with support of the rig while also pouring cement down the well at depths deemed safe and clear enough to pour cement. Pressure testing of the well is frequently conducted to identify any safety risks.

• As the work nears the top segment of the well, the operator continues to use the rig and cement trucks are brought to the drill site to fill the well with cement. The ending segment can include up to 600 cubic feet of cement into the well’s casings in order to displace any well fluids or debris. The operator will fill the well casing to the near very top and this process is observed by CalGEM and by the Los Angeles Fire Department.

• At the conclusion, the operator removes any blowout prevention equipment from the rig and the well is closed and steel welded with the API Number and the LAFD Well Number identified on the top cover.

Given the varied timeline of individual well abandonment and the fact the Ordinance does not establish any regulations related to well site remediation or redevelopment (except where mitigation measures are required to reduce identified potentially significant
impacts), it would be speculative to contemplate when site remediation would occur after
the wells are abandoned and the types of redevelopment and future land uses that may
occur on former drill sites. What might get built and at what intensity or scale is not
possible to identify or analyze at this time. Therefore, the scope of analysis in this Initial
Study is limited to (1) cessation of oil and gas extraction in the city and (2) abandonment
activities that are reasonably foreseeable. The analysis does not examine impacts from
remediation and/or future development. Those impacts would be analyzed in subsequent
environmental analyses at either the programmatic or project level.

Methodology

The City’s method assumes that well operations will cease in accordance with the
requirements of the Ordinance and that the abandonment of oil wells that permanently
cease operations is a reasonably foreseeable outcome. Furthermore, the methodology
is based upon the fact the well abandonment activities will comply with existing federal,
state and local laws, ordinances and regulations. To date, there is no specified timeline
for the abandonment of wells, as operators could continue to operate through the 20-year
amortization period.

Additionally, the City is not modifying its existing land use plans and is making limited
amendments to its zoning code to make oil drilling a non-conforming use. The reasonably
foreseeable result of this ordinance is the abandonment of wells, but not the
redevelopment of any well sites, as such analysis of future land uses would be
speculative.

While this environmental document appropriately presents a program level analysis,
specific assumptions were made regarding the methods for well abandonment based on
case studies, and other information made available to the City regarding the well
abandonment process. As such, this analysis represents a good faith effort by the City to
analyze the reasonably foreseeable environmental impacts resulting from the adoption
and implementation of the proposed Ordinance. Detailed assumptions are provided in the
Report which are included as appendices to this Initial Study.

3.4 REQUESTED PERMITS AND APPROVALS

The Initial Study will analyze impacts associated with the Project and will provide
environmental review sufficient for all necessary entitlements and public agency actions
associated with the Project. The discretionary entitlements, reviews, permits and
approvals required to implement the Project include, but are not necessarily limited to, an
amendment to the Zoning Code, in accordance with City Charter Section 558 and LAMC
Section 12.32, that will create the Oil and Gas Drilling Ordinance.
INITIAL STUDY

4 ENVIRONMENTAL IMPACT ANALYSIS

I. AESTHETICS

Except as provided in Public Resources Code Section 21099, would the project:

<table>
<thead>
<tr>
<th>Potentially Significant Impact</th>
<th>Less Than Significant with Mitigation Incorporated</th>
<th>Less Than Significant Impact</th>
<th>No Impact</th>
</tr>
</thead>
</table>

a. Have a substantial adverse effect on a scenic vista?

☐ ☐ ☐ ☒

b. Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

☐ ☐ ☐ ☒

c. In non-urbanized areas, substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from a publicly accessible vantage point). If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?

☐ ☐ ☐ ☒

d. Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

☐ ☐ ☐ ☒

a) Have a substantial adverse effect on a scenic vista?

No Impact.

The Project provides for the termination of all nonconforming oil uses over a 20-year amortization period, potentially resulting in the abandonment of existing wells. The cessation of oil extraction activities would not result in an adverse effect on a scenic vista as there would be no visible change at most sites as a result of the Project. In addition, abandonment activities will not result in significant physical changes to a scenic vista as
these activities do not include the construction of any new structures which could impede views or otherwise impact scenic vistas. Further, any abandonment activities would be temporarily occurring over the course of a few days or weeks (at most sites). As such, there would be no permanent change in any scenic vista. Further, the Oil Ordinance’s prohibition on new oil and drilling activities citywide will prevent the installation of additional facilities that could be visible from a scenic vista. As such, there will be no impacts.

b) Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings, or other locally recognized desirable aesthetic natural feature within a state scenic highway?

No Impact.

Currently, the only portion of a scenic highway officially designated by the California Department of Transportation (Caltrans) in Los Angeles County is the 2 Freeway near La Canada-Flintridge.

Within the City of Los Angeles, a six-mile portion of the Pasadena Freeway (also known as the Arroyo Seco Historic Parkway) from milepost 25.7 to 31.9 is designated as a Historic Parkway and other portions of freeways are considered eligible but not officially designated including 2.5 miles of Topanga Canyon State Scenic Highway (State Route 27).17 There are 14 wells within a half mile of radius of Scenic Highways in the City of Los Angeles. All 14 wells are inactive and plugged.18

Implementation of the Oil Ordinance will not result in any damage to scenic resources, including but not limited to, trees, historic buildings, rock outcroppings, or similar resources, within a state scenic highway as there would be no disturbance of previously undisturbed areas. As such, there would be no opportunity to damage scenic resources. Equipment in place at well sites would not be removed as a result of this Ordinance. The Ordinance prohibits the drilling of any new wells and the redrilling of existing wells which will prevent the installation of new facilities within these areas preventing the possibility of future impacts. Further, activities associated with well abandonment will be isolated to sites formerly used for oil and drilling activities and will not be located on land designated for state scenic highways. No impact would occur.

c) In non-urbanized areas, substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those

18 Caltrans, California Scenic Highway System Map, 2022, available at: https://caltrans.maps.arcgis.com/apps/webappviewer/index.html?id=465df3d807c46cc8e8057116f1aacaa
that are experienced from a publicly accessible vantage point). If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?

**No Impact.**

For purposes of analysis, the entirety of the City is considered an urbanized area. Drill sites are located throughout the City, but many wells are also located in M3 zones, where only minimal standards relating to scenic quality exist, as shown in the project description. Some wells are located in residential zones where Community Plans are applicable containing scenic quality policies related to protecting single family and low-density neighborhoods from encroachment by higher density and other incompatible uses, protecting prominent vistas (such as hillsides), and protecting tree cover. The Ordinance would be consistent with these policies as it would, over the lifetime of the Ordinance, eliminate oil drilling in residential neighborhoods. Further, it would not conflict with any policies related to tree cover or protection of vistas as no new development would occur as a result of its implementation. As such, no impact would occur.

**d) Create a new source of substantial light or glare which would adversely affect daytime or nighttime views in the area?**

**No Impact.**

Light impacts are typically associated with the use of artificial light during the evening and nighttime hours. Glare may be a daytime occurrence caused by the reflection of sunlight or artificial light from highly polished surfaces, such as window glass and reflective cladding materials, and may interfere with the safe operation of a motor vehicle on adjacent streets. Daytime glare is common in urban areas and is typically associated with mid- to high-rise buildings with exterior façades largely or entirely comprised of highly reflective glass or mirror-like materials. Nighttime glare is primarily associated with bright point-source lighting that contrasts with existing low ambient light conditions.

Implementation of the Ordinance will not result in substantial impacts related to light or glare, as none of the conditions described above would occur. No new development is authorized as part of the proposed Ordinance. Light sources associated with abandonment activities would be temporary in nature and would be required to adhere to all applicable regulations. Therefore, no impacts would occur.

---

19 According to CEQA Guidelines Section 15387 an “urbanized area” means a central city or a group of contiguous cities with a population of 50,000 or more, together with adjacent densely populated areas having a population density of at least 1,000 persons per square mile.
II. AGRICULTURE AND FORESTRY RESOURCES

In determining whether impacts to agricultural resources are significant environmental effects, lead agencies may refer to the California Agricultural Land Evaluation and Site Assessment Model (1997) prepared by the California Department of Conservation as an optional model to use in assessing impacts on agriculture and farmland. In determining whether impacts to forest resources, including timberland, are significant environmental effects, lead agencies may refer to information compiled by the California Department of Forestry and Fire Protection regarding the state’s inventory of forest land, including the Forest and Range Assessment Project and the Forest Legacy Assessment Project; and forest carbon measurement methodology provided in Forest Protocols adopted by the California Air Resources Board.

<table>

a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?

b) Conflict with existing zoning for agricultural use, or a Williamson Act contract?

c) Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?  

d) Result in the loss of forest land or conversion of forest land to non-forest use?

e) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland to non-agricultural use or conversion of forest land to non-forest use?

No Impact.

Implementation of the Ordinance would not convert farmland to non-agricultural use, affect an agricultural preserve eligible for enrollment under a Williamson Act contract, or impact forest land or timberland. The Ordinance would not conflict with existing zoning for, or cause rezoning of, forest land or timberland. The Ordinance does not propose any changes to existing zoning or any new development that could reduce agricultural uses within the City. Therefore, the Ordinance would have no impact related to agricultural and forestry resources as there are no such resources that would be impacted by the Ordinance.

III. AIR QUALITY

The following is based on the Project’s Air Quality and GHG Technical Report included as Appendix A to this Initial Study. The responses to the checklist questions below summarize the Project’s potential air quality impacts found therein. For additional details related to air quality setting, regulatory framework, assumptions, methodology, and impact analyses, please refer to Appendix A to this Initial Study.
Would the project:

a. Conflict with or obstruct implementation of the applicable air quality plan? ☐ ☐ ☒ ☐

b. Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard? ☐ ☐ ☒ ☐

c. Expose sensitive receptors to substantial pollutant concentrations? ☐ ☐ ☒ ☐

d. Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people? ☐ ☐ ☒ ☐

a) Conflict with or obstruct implementation of the applicable air quality plan?

Less than Significant Impact.

As part of its enforcement responsibilities, the EPA requires each state with nonattainment areas to prepare and submit a State Implementation Plan (SIP) that demonstrates the means to attain the federal standards. The SIP must integrate federal, state, and local plan components and regulations to identify specific measures to reduce pollution in nonattainment areas, using a combination of performance standards and market-based programs. Similarly, under state law, the CCAA requires an air quality attainment plan to be prepared for areas designated as nonattainment with regard to the federal and state ambient air quality standards. Air quality attainment plans outline emissions limits and control measures to achieve and maintain these standards by the earliest practical date.

The 2016 AQMP was drafted by the SCAQMD and was developed in effort with CARB, SCAG, and the EPA to establish a program of rules and regulations to reduce air pollutant emissions to achieve California Ambient Air Quality Standards (CAAQS) and National Ambient Air Quality Standards (NAAQS). The plan’s pollutant control strategies are

---

based on SCAG’s Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS). While SCAG adopted the updated 2020-2045 RTP/SCS in September 2020, it has not been incorporated into an applicable air quality plan.

Criteria for determining consistency with the AQMP are defined in Chapter 12, Section 12.2 and Section 12.3 of the SCAQMD’s 1993 CEQA Air Quality Handbook, and include the following:

- Consistency Criterion No. 1: The project will not result in an increase in the frequency or severity of an existing air quality violation, or cause or contribute to new violations, or delay the timely attainment of air quality standards or the interim emissions reductions specified in the AQMP.

- Consistency Criterion No. 2: The project will not exceed the assumptions in the AQMP or increments based on the years of the project build-out phase.

The violations to which Consistency Criterion No. 1 refers are the CAAQS and the NAAQS. As evaluated under air quality checklist question (b) below, the Ordinance would not exceed the short-term standards or long-term standards and, thus, would not have the potential to violate any air quality standards. Thus, the Ordinance would be consistent with first criterion.

With respect to Consistency Criterion No. 2, the 2016 AQMP contains air pollutant reduction strategies based on SCAG’s growth forecasts, and SCAG’s growth forecasts were defined in consultation with local governments and with reference to local general plans. The Ordinance would not result in any changes to housing or population forecasts for the City or the region as a whole. Therefore, the Ordinance would not exceed the assumptions utilized to develop the 2016 AQMP and the Ordinance would be consistent with the second criterion. As such, because the Ordinance would be consistent with the criteria for demonstrating consistency with the AQMP, the Ordinance would not have the potential to conflict with or obstruct implementation of any applicable air quality plan and this impact is less than significant.

b) Result in a cumulatively considerable net increase of any criteria pollutant for which the air basin is non-attainment under an applicable federal or state ambient air quality standard?

Less than Significant Impact.

Short-Term and Temporary Air Quality Emissions

The abandonment of oil wells entails plugging the wells in place in accordance with California Statutes and Regulations and all other applicable requirements as overseen by
CalGEM. The process of well abandonment will be determined on a case-by-case basis under the regulatory supervision of CalGEM and the LAFD and will depend on individual site conditions such as type and depth of well. However, for the purposes of this environmental analysis, several generalized assumptions have been made based upon standard industry practice, existing regulations governing well abandonment, and case studies. While plugging and abandonment varies by well, there is a consistent set of procedures that are followed. Generally, the drill site’s existing drilling or maintenance rig will be used to abandon the well and remove equipment from the well.\textsuperscript{21} Well equipment will be removed from the site by truck. Cement trucks will also arrive onsite to fill the well at various depths over a span of several days. An operator may use in excess of 2,500 cubic feet of cement for one abandonment. The process entails removing equipment and filling the well with cement at different phases in order to ensure that it is safe to abandon the well at varying depths. At the end of each work day, the well site is closed and the rig is shut down in order to resume operations the following work day. See the Project Description section for the anticipated steps of well abandonment.

For purposes of estimating potential air quality associated with abandonment activities, it is assumed each well abandonment would last approximately two weeks (i.e., 10 work days), and on-site equipment would include one workover rig, one cement pump truck, one welder, and one tractor/loader/backhoe. On-road activity was estimated to include 10 worker trips per day (travel to and from the well locations) and 3 truck trips per day. This analysis conservatively assumes that all pieces of equipment would operate concurrently on a peak day, presenting a worst-case impact scenario.

Abandonment activities would generate short-term emissions of criteria air pollutants. The criteria pollutants of primary concern include ozone-precursor pollutants (i.e., ROG and NOx), PM10, and PM2.5. Abandonment-generated emissions are short term and of temporary duration, lasting only as long as activities occur, but would be considered a significant air quality impact if the volume of pollutants generated exceeds the SCAQMD’s thresholds of significance. Abandonment activities would be required to comply with all applicable SCAQMD Rules, which may include, but not be limited to: Rule 401 (Visible Emissions), Rule 402 (Nuisance), Rule 403 (Fugitive Dust – Trucks and Unpaved Roads), Rule 1186 (PM10 Emissions from Paved and Unpaved Roads), Rule 1148 (Thermally Enhanced Oil Recovery Wells), Rule 1148.1 (Oil and Gas Extraction Wells), Rule 1148.2 (Notification and Reporting Requirements for Oil and Gas Wells and Chemical Suppliers), and Rule 1470 (Requirements for Stationary Diesel-Fueled Internal Combustion and Other Compression Ignition Engines). These Rules are discussed in greater detail in Section 2.4, Regulatory Framework, of the Project’s Air Quality and GHG Technical

\textsuperscript{21} When a drilling or maintenance rig is not on the well site, a rig will need to be brought to the site to complete the abandonment process.
Report (see Appendix A to this Initial Study). The estimated maximum daily abandonment related air quality emissions are summarized in Table 6, Oil & Gas Well Abandonment Emissions (Per Well) – Pounds Per Day.

Source: Impact Sciences, September 2022. See Appendix A to this Initial Study.

As shown in Table 6, on a per-well basis, the peak daily emissions generated during abandonment would not exceed any of the regional emission thresholds recommended by the SCAQMD. As discussed previously, abandonment of individual wells may occur at any time during the 20-year timeframe, and potentially beyond the 20-year timeframe. It would be speculative to assess how many wells would be abandoned during a given year, month, or peak day. Nevertheless, for illustrative purposes, based on the peak daily emissions identified in Table 6 for a single well, it is possible for up to approximately 19 wells to be abandoned concurrently (i.e., overlapping on a peak day) without exceeding any of the regional emission thresholds recommended by the SCAQMD. Therefore, the Ordinance would not result in a cumulatively considerable net increase of any criteria air pollutant for which the region is in nonattainment and this impact is less than significant.

**Long-Term Air Quality Emissions**

Oil and gas operations throughout the City contribute to local and regional air quality conditions. Upon full implementation of the Ordinance, existing emission sources associated with oil and gas wells would no longer occur, and long-term air quality emissions would be decreased compared to existing emissions associated with oil and gas extraction throughout the City. The following discussion identifies the potential air quality emissions that may be avoided as a result of the Ordinance.

Long-term air quality emissions fall into two general categories: 1) worker commutes and 2) fugitive emissions. Typical emissions from worker commutes (i.e., motor vehicle trips) include ROG, NOx, CO, SOx, PM10 and PM2.5. Fugitive emissions include ROGs (also
referred to as volatile organic compounds) which may include but not be limited to pentane, n-pentane, hexane, ethane, and other longer-chain hydrocarbons. In general, fugitive emissions from oil and gas activities may be attributed to the following primary types of sources: fugitive equipment leaks; process venting; evaporation losses; disposal of waste gas streams (e.g., by venting or flaring), and accidents and equipment failures. Fugitive leaks from piping and equipment are typically small yet detectable emissions from equipment where there are joints, flanges, and seals. Although joints and flanges are typically bolted, small amounts of hydrocarbons may be emitted through leaky joints.

It should be noted that fugitive emissions are difficult to quantify with a high degree of accuracy and there remains substantial uncertainty in the emission factors and calculation methodologies for oil and gas activities. This is due to the numerous types of sources and many variables to be considered. The key emission assessment issues are: (a) use of simple extraction based emission factors is susceptible to excessive errors; (b) use of rigorous bottom-up approaches requires expert knowledge to apply and relies on detailed data which may be difficult and costly to obtain; and (c) measurement programs are time consuming and very costly to perform. Furthermore, Table 7, Avoided Oil & Gas Air Quality Emissions – Pounds per Day, has been included in an effort to illustrate the potential scope of air quality emissions that may be avoided as a result of the Ordinance. Due to the programmatic nature of this analysis and the many variables at each oil and gas well throughout the City, the quantified estimates in Table 7 are included as a good-faith effort for illustrative purposes. Furthermore, while it is clear the Ordinance would result in a net benefit to local and regional air quality conditions, the degree to which air quality emissions may be avoided under the Ordinance is not the basis for the impact determination. Because the Ordinance would reduce long-term air quality emissions compared to existing emissions associated with oil and gas extraction throughout the City, the Ordinance would not result in a cumulatively considerable net increase of any criteria air pollutant for which the region is in nonattainment and this impact is less than significant.

c) Expose sensitive receptors to substantial pollutant concentrations?

Less than Significant Impact.

Localized Air Quality Emissions

The SCAQMD has developed localized significance thresholds (LST) that represent the maximum emissions from a project that are not expected to cause or contribute to an exceedance of the applicable federal or State ambient air quality standard. LSTs are provided for each source receptor area (SRA) and various distances from the source of emissions. As the Ordinance is citywide, activities under the Ordinance could occur in parts of eight SRAs in the Coastal, Metropolitan, San Fernando Valley, and San Gabriel Valley areas. The LSTs applicable to the Ordinance are presented in Table 7 of the Project’s Air Quality and GHG Technical Report (see Appendix A to this Initial Study). The closest receptor distance in the SCAQMD’s mass rate look-up tables is 25 meters. Projects that are located closer than 25 meters to the nearest receptor are directed to use the LSTs for receptors located within 25 meters. Abandonment activities would generate short-term localized emissions of criteria air pollutants. While abandonment-generated emissions are short term and of temporary duration, the emissions could be considered a significant air quality impact if the pollutants exceed the SCAQMD’s LSTs.

As shown in Table 8, Localized Oil & Gas Well Abandonment Emissions (Per Well) – Pounds Per Day, the Ordinance would not exceed any of the identified localized thresholds of significance during abandonment. Therefore, the Ordinance would not

---

24 The SRAs include: SRA 1, described as Central Los Angeles County; SRA 2, described as Northwest Los Angeles County Coastal; SRA 3, described as Southwest Los Angeles County Coastal; SRA 4, described as South Los Angeles County Coastal; SRA 6, described as West San Fernando Valley; SRA 7, described as East San Fernando Valley; SRA 8, described as West San Gabriel Valley; and SRA 12, described as South Central Los Angeles County.
expose sensitive receptors to substantial air pollutant concentrations and these impacts would be less than significant.

### Diesel Particulate Matter

The use of diesel-powered equipment and trucks during abandonment would result in the generation of diesel particulate matter (diesel PM) emissions. The amount to which the sensitive receptors are exposed (a function of concentration and duration of exposure) is the primary factor used to determine health risk (i.e., potential exposure to TAC emission levels that exceed applicable standards). Health-related risks associated with diesel-exhaust emissions are primarily linked to long-term exposure and the associated risk of contracting cancer.

The use of diesel-powered construction equipment and trucks would be temporary and episodic. The duration of exposure would be short and exhaust from construction equipment dissipates rapidly. Current methodologies for conducting health risk assessments are associated with long term exposure periods (9, 30, and 70 years). As discussed previously, typical abandonment activities are expected to last for approximately 10 work days. Therefore, short-term abandonment activities would not have the potential to generate a significant health risk. Furthermore, abandonment activities would be subject to and would comply with California regulations limiting the idling of heavy-duty construction equipment to no more than 5-minutes, which would further reduce nearby sensitive receptors’ exposure to temporary and variable DPM emissions. For these reasons, DPM emissions associated with abandonment would not expose sensitive receptors to substantial amounts of air toxics and this impact is less than significant.

d) Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?

**Less than Significant Impact.**

The SCAQMD *CEQA Air Quality Handbook* (1993) identifies certain land uses as sources of odors. These land uses include agriculture (farming and livestock), wastewater treatment plants, food processing plants, chemical plants, composting facilities, refineries, landfills, dairies, and fiberglass molding.

Existing oil and gas operations throughout the City contribute to localized emissions that lead to odors. Several compounds associated with the oil and gas industry can produce nuisance odors. Sulfur compounds found in oil and gas have very low odor detection levels. Many volatile compounds found in oil and gas (e.g., pentane, n-pentane, hexane, ethane, and other longer-chain hydrocarbons) typically have a petroleum or gasoline-type odor. An odor “event” is generally considered a scenario where odors are released and negatively impact the surrounding community, measured as generating odor complaints to the SCAQMD and confirmed by the SCAQMD as attributable to a specific source.

During abandonment activities, the two primary sources of potential odors are fugitive well emissions and diesel exhaust from equipment and trucks. As abandonment activities are anticipated to last approximately 10 work days, these emission sources and associated odors would be temporary and intermittent, and affecting only those receptors located in proximity to the wells. In addition, abandonment activities would be subject to SCAQMD Rule 402 (Nuisance) and California Code of Regulations, Title 13, sections 2449(d)(3) and 2485, which minimizes the idling time of construction equipment either by shutting it off when not in use or by reducing the time of idling to no more than five minutes. These regulations would serve to minimize temporary and intermittent odors. As oil and gas operations cease, existing oil and gas well emissions leading to odors would no longer occur, and long-term odors would be decreased compared to existing conditions. Therefore, the Ordinance would not create other emissions leading to odors adversely affecting a substantial number of people, and this impact is less than significant.
IV. BIOLOGICAL RESOURCES

Would the project:

a. Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service? ☒

b. Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Wildlife or US Fish and Wildlife Service? ☒

c. Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means? ☒

d. Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites? ☒

e. Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance? ☒
f. Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

☐ Potentially Significant Impact ☐ Less Than Significant with Mitigation Incorporated ☐ Less Than Significant Impact ☒ No Impact

a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?

Less than Significant Impact.

The Ordinance will prohibit new oil and gas extraction and require existing operations to cease within a 20-year amortization period. Twenty-five wells are located within Significant Ecological Areas (SEAs).26 Six of these wells are active, while the remainder are inactive and plugged. Idle and abandoned wells are required to comply with LAFD regulations regarding brush clearance and other general maintenance that make these wells unlikely to provide biological resources in the form of habitat, species, or plant communities. Therefore, threatened, endangered, protected and sensitive species and habitats are not anticipated to be affected at these sites. Short-term abandonment activities that could occur at active and idle well sites will generally be limited to previously developed and disturbed areas and will not involve the removal of trees or vegetation that are habitat for candidate, sensitive, or special status species. In some cases, temporary accessways may be required to bring equipment to the well sites to complete the abandonment process. In these cases, the lead agency (i.e., the City) would require any necessary permits in accordance with applicable regulations and would ensure impacts to biological resources would not occur. Thus, impacts would be less than significant, and no mitigation is required.

b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?

Less than Significant Impact.

26 City of Los Angeles GeoHub, Significant Ecological Area (SEA), 2022.
Existing active and idle oil wells currently undergo either regular operations or site maintenance activities (such as brush clearance in accordance with LAFD requirements). As such, it is unlikely that these sites would provide riparian habitat or support sensitive natural communities. While six active wells are located in SEAs, the Ordinance would not require new activity at the wells beyond compliance with local and state requirements for abandonment. Such activities would be limited to accessing the wells to follow proper procedures and would not add any new permanent structures to the sites that could adversely affect sensitive natural communities. Due to the limited nature of activity at the well sites, and the fact that wells are currently not providing any valuable habitat, impacts would be less than significant, and no mitigation is required.

c) Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Less than Significant Impact.

Short-term abandonment activities at existing well sites will be limited to previously developed and/or disturbed areas and, therefore, will not disturb any protected wetlands through direct removal, filling, hydrological interruption or other means. Therefore, impacts to wetlands would be less than significant and no mitigation is required.

d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Less than Significant Impact.

As described in the preceding sections, well sites are not likely to offer any viable habitat. Further, the abandonment process generally requires limited disturbance to the surrounding area and would not interfere with any migratory species. Mature trees may be located near well sites. Although these trees are likely to be mainly ornamental and nonnative, they may provide suitable habitat, including nesting habitat, for migratory birds. Activities that occur pursuant to the Ordinance would be limited to accessing and abandoning the wells themselves and would not interfere with any mature trees where nesting could occur. Thus, impacts would be less than significant, and no mitigation is required.

e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

No Impact.
LAMC Sec. 46, the Tree Preservation Ordinance, (Ordinance No. 177,404) applies to protected trees (4 inches and greater in cumulative diameter at breast height) that are located on public and private properties. Protected tree removal requires a removal permit by the City of Los Angeles Department of Public Works (LADPW). Any act that may cause the failure or death of a protected tree requires inspection by the LADPW’s Urban Forestry Division. The following tree species are protected: all native Oak tree species (*Quercus* spp, with the exception of scrub oak, *Quercus berberidifolia*), Western or California Sycamore (*Platanus racemosa*), California Bay (*Umbellularia californica*), Southern California Black Walnut (*Juglans californica*). In addition, on December 11, 2020, the City adopted Ordinance No. 186,873, extending protection status to include two native shrub species; Mexican elderberry (*Sambucus mexicana*) and toyon (*Heteromeles arbutifolia*). Activities associated with well operation cessation and subsequent abandonment would not involve the removal of trees or shrubs that would potentially conflict with the City’s tree preservation policies and ordinance. Therefore, no impacts will occur.

f) **Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?**

No Impact.

There are no Habitat Conservation Plans, or Natural Community Conservation Plans, or other approved habitat conservation plans that could be affected by the implementation of the Ordinance in the City of Los Angeles. As described above, the Ordinance does not have the possibility of impacting biological or sensitive resources that are protected within any existing plans. No impacts would occur, and no mitigation is required.

**V. CULTURAL RESOURCES**

<table>
<thead>
<tr>
<th>Potentially Significant Impact</th>

</table>

Would the project:

a. **Cause a substantial adverse change in the significance of a historical resource pursuant to § 15064.5?**

☐ ☐ ☒ ☐

b. **Cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?**

☐ ☐ ☒ ☐
c. Disturb any human remains, including those interred outside of dedicated cemeteries?

☐ ☐ ☒ ☐

a) Cause a substantial adverse change in the significance of a historical resource as pursuant to State CEQA Guidelines §15064.5?

Less than Significant Impact.

The Ordinance will prohibit new oil and gas extraction and require existing operations to cease within a 20-year amortization period. Although not regulated by the Ordinance, well abandonment is a reasonably foreseeable outcome for many of the wells currently operating in the City. Therefore, the scope of this analysis is limited to the impacts of well cessation and abandonment. The anticipated abandonment activities are provided in the Project Description.

Section 15064.5(b) of the CEQA Guidelines states that a project would have a significant impact on historic resources if it would result in a substantial adverse change in the significance of a historic resource. Section 15064.5(a) of the CEQA Guidelines defines a historic resource as: 1) listed in, or determined to be eligible for listing, in the California Register of Historical Resources (CRHR); 2) included in a local register of historical resources; or 3) identified as significant in an historical resources survey. Any object, building, structure, site, area, place, record, or manuscript may be historically significant if the resource meets the criteria for listing on the CRHR.27 The CRHR automatically includes all properties listed in or formally determined to be eligible for listing the National Register of Historic Places (NRHP).

To be eligible for listing in the NRHP, a property must be at least 50 years of age (unless it is of “exceptional importance”) and be significant in American history and culture, architecture, or archaeology. A property of potential significance must meet one or more of the following four established criteria:

1. Associated with events that have made a significant contribution to American history;

2. Associated with the historically significant persons;

---

27 CEQA Guidelines §15064.5(a)(3).
3. Embody distinctive characteristics of a type, period, or method of construction/work of a master; possess high artistic values; or represent a significant and distinguishable entity; or

4. Yield information important in prehistory or history.

To be eligible for listing in the CRHR, a property generally must be at least 50 years of age and be significant at the local, state, or national level under one or more of the following four criteria:

1. Associated with events that have made a significant contribution to the broad patterns of local or regional history in California or the United States;

2. Associated with the lives of persons important to local, California, or national history;

3. Embody the distinctive characteristics of a type, period, or method of construction or represents the work of a master, or possesses high artistic values; or

4. Yielded information important in the prehistory or history of the local area, California, or the country.

The CRHR consists of properties that are listed automatically as well as those that must be nominated through an application and public hearing process.

According to HistoricPlacesLA, there is one oil well facility, the Cardiff Tower Oil Well Facility (also known as the West Pico Drill site), which appears eligible for National Register, State Register, and local listing or designation as a historic resource. Five facilities are identified as requiring additional research to determine their eligibility as a historic resource: the Hillcrest Country Club Oil Wells, the Rancho Park Golf Course Oil Wells, the Los Angeles Downtown Oil Wells, the 23rd Street - St. James Place Oil Wells (Allenco Drill Site), and the San Vicente Drill Site. These are sites where oil operations are either currently occurring or have occurred in the past that may have historical significance for the City. Following a review of the national, State and local registers for designated historic resources, it was determined that none of the oil facilities are officially designated historic resources.28,29,30 In addition, the Ordinance and any associated abandonment activities will not require demolition or substantial alterations of existing

structures on these sites. Typical well abandonment activities as described in the **Project Description** would not require the removal of structures or otherwise cause a change to a historical resource. While some activities would occur on the site during the abandonment process (i.e., construction equipment and/or trucks accessing the well site) such activities would not permanently change the area surrounding the well. The reasonably foreseeable result of this Ordinance is the abandonment of wells, but not the redevelopment of any well sites, and such analysis of future land uses would be speculative at this time. Further, any potential impacts to eligible resources associated with future potential site redevelopment, change to, or demolition of such resources would require case-by-case CEQA analysis and historical resource review by the Los Angeles City Planning’s Office of Historic Resources (OHR) before a demolition or building permit can be pulled. Based on the above, it is speculative at this time to identify the loss of any particular resource and it is not foreseeable that an impact could occur to a significant historical resource pursuant to **State CEQA Guidelines §15064.5**. Therefore, impacts would be less than significant, and mitigation is not required.

b) **Cause a substantial adverse change in the significance of an archaeological resource pursuant to **State CEQA Guidelines §15064.5**?**

**Less than Significant Impact.**

California Public Resources Code Section 21083.2 provides guidelines for accidental discovery of archeological resources during ground disturbing activities. It is expected that most properties developed with wells have been previously disturbed to depths beyond where archeological resources would be found. Therefore, archaeological resources are unlikely to be uncovered when wells are abandoned. Although minor grading may occur during the abandonment process, such activities would be limited to previously disturbed areas where resources are unlikely to be located due to past disturbance. No excavation of previously undisturbed soils would occur as a result of the Ordinance that would have the potential to result in newly discovered resources. Therefore, impacts would be less than significant and no mitigation is required.

c) **Disturb any human remains, including those interred outside of formal cemeteries?**

**Less than Significant Impact.**

In the event that human remains are uncovered during ground-disturbing activities, there are regulatory provisions to address the handling of human remains in California Health and Safety Code Section 7050.5, Public Resource Code 5097.98, and **CEQA Guidelines Section 15064.5(e)**. However, as described above, well sites have been previously excavated to depths beyond which it would be expected to find human remains. Although
minor grading may occur during the abandonment process, such activities would be limited to previously disturbed areas where resources are unlikely to be located due to past disturbance. Further, any temporary roadways necessary to access well sites or bring temporary equipment to the sites would be subject to review by the City through its permitting process. No excavation of previously undisturbed soils would occur as a result of the Ordinance that would have the potential to result in newly discovered resources. Therefore, impacts would be less than significant and no mitigation is required.

VI. ENERGY

<td>☐</td>
<td>☐</td>
<td>☒</td>
</tr>
</tbody>
</table>

a) Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?

Less than Significant Impact.

Although not regulated by the Ordinance, well abandonment is a reasonably foreseeable outcome for many of the wells currently operating in the City, although as stated previously, no specific timeline for abandonment currently exists and the Ordinance does not include any regulations related to the timing of the abandonment of oil wells. As such, for purposes of this analysis, there are two distinct phases that would have the potential to change consumption of energy resources: 1) Short-term and temporary abandonment related activities, and 2) Long-term changes attributable to the cessation of oil and gas extraction and operations.

Activities associated with abandonment would require the use of energy associated with worker vehicle trips, truck trips, and use of equipment. However, the consumption of
energy associated with these activities would be short term and temporary and would occur in accordance with all applicable rules and regulations associated with the operation of motor vehicles, trucks and equipment. As such, the consumption of energy during abandonment would not be wasteful, inefficient, or unnecessary. With respect to long-term changes associated with the consumption of energy resources, the Ordinance is a reflection of State, regional, and local goals to move away from reliance on oil and gas energy sources. The State has enacted numerous legislative regulations to reduce dependence on fossil fuels and improve energy efficiency. California’s Renewable Portfolio Standards established by Senate Bill 1078 requires that 60% of electricity generation be produced from clean renewable sources by 2030 and that the state become carbon-free by 2045. This has contributed to California’s move away from electricity powered by coal and natural gas and a progressive increase in the use of solar and wind energy sources. This has occurred for both utility scale energy generation as well as for new single-family residential uses which are required to meet their electricity needs by installing solar panels under the State’s Title 24 building standards. For passenger vehicles, Executive Order N-79-20 would ban the sales of new gasoline and diesel passenger vehicles while requiring that only new zero-emission vehicles be sold by 2035. This Executive Order is also consistent with CARB’s regulations transitioning from diesel trucks and vans to zero emission trucks, and public bus fleets to be fully electric by 2040. See also Table 4 and Table 5 in the Project Description for a comprehensive list of state, regional, and City policies that support the Ordinance.

As such, the Ordinance would not result in the wasteful, inefficient, or unnecessary consumption of energy resources and this impact would be less than significant.

b) Conflict with or obstruct a state or local plan for renewable energy or energy efficiency?

No Impact.

As discussed above, the Ordinance is a reflection of state, regional, and local goals to move away from reliance on oil and gas energy sources. The State has enacted numerous legislative regulations to reduce our dependence on fossil fuels and improve energy efficiency. California’s Renewable Portfolio Standards established by Senate Bill 1078 requires that 60% of electricity generation be produced from clean renewable sources by 2030 and that the state become carbon-free by 2045. This has contributed to California’s move away from electricity powered by coal and natural gas and a progressive increase in the use of solar and wind energy sources. This has occurred for both utility scale energy generation as well as for new single-family residential uses which are required to meet their electricity needs by installing solar panels under the State’s Title 24 building standards. For passenger vehicles, Executive Order N-79-20 would ban...
the sales of new gasoline and diesel passenger vehicles while requiring that only new zero-emission vehicles be sold by 2035. This Executive Order is also consistent with CARB’s regulations transitioning from diesel trucks and vans to zero emission trucks, and public bus fleets to be fully electric by 2040. See also Tables 4 and 5 in the **Project Description** for a comprehensive list of state, regional, and City policies that support the Ordinance. As such, the Ordinance is reflective of state and local plans for renewable energy and energy efficiency through the elimination of oil drilling in the City. No impact would occur.

### VII. GEOLOGY AND SOILS

In 2015, the California Supreme Court in *California Building Industry Association v. Bay Area Air Quality Management District* (*CBIA v. BAAQMD*), held that CEQA generally does not require a lead agency to consider the impacts of the existing environment on the future residents or users of a project. However, if a project exacerbates a condition in the existing environment, the lead agency is required to analyze the impact of that exacerbated condition on future residents and users of a project, as well as other impacted individuals.

</tbody>
</table>

a) Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.

ii) Strong seismic ground shaking?

iii) Seismic-related ground failure, including liquefaction?

iv) Landslides?

No Impact.
Fault rupture is the displacement that occurs along the surface of a fault during an earthquake. The California Geological Survey (CGS) designates Alquist-Priolo Earthquake Fault Zones, which are regulatory zones around active faults. These zones, which extend from 200 to 500 feet on each side of known active faults, identify areas where potential surface ruptures along active faults could prove hazardous and identify where special studies are required to characterize hazards to habitable structures. There are several Alquist-Priolo Fault Zones located in the City.

The Ordinance does not include the construction of any new structures, such as housing or other uses that could potentially result in risk including loss, injury, or death. Any abandonment activities that would occur indirectly as a result of the ordinance would be conducted in accordance with CalGEM and LAFD requirement to ensure safety. The Ordinance is limited to the cessation of oil drilling in the City and would not directly or indirectly exacerbate geologic hazards related to rupture, ground shaking, liquefaction or landslides. No impact would occur.

b) Result in substantial soil erosion or the loss of topsoil?

**No Impact.**

Erosion is the movement of rock and soil from place to place and is a natural process. Common agents of erosion in the City include wind and flowing water. Significant erosion typically occurs on steep slopes where stormwater and high winds can carry topsoil down hillsides. Erosion can be increased greatly by earthmoving activities if erosion-control measures are not used. Cessation of oil drilling at well sites would not result in any activities that could increase soil erosion. The abandonment process would be conducted in accordance with CalGEM and LAFD requirements and would not result in exposed topsoil or similar conditions where erosion could occur. No impacts would occur.

c) Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse?

**Less than Significant Impact.**

Landslides are movements of large masses of rock and/or soil. Landslide potential is generally the greatest for areas with steep and/or high slopes, low shear strength, and increased water pressure. Subsidence is the sinking or gradual lowering of the earth's surface. Subsidence can result from either natural geologic and/or man-made causes and is found both on land and on the seafloor. Natural geologic causes are basin-downwarp, fault movement, sediment compaction, and relaxation of deep earth stresses. Man-made causes include groundwater pumping, mining, oil and gas production, river
channelization, and surface loading. A subsided area can vary in size from a few acres to thousands of square miles. Elevation losses can be from a fraction of an inch to tens of feet.

The Wilmington Oil Field underlies both the City of Los Angeles and the City of Long Beach. Oil or gas withdrawal subsidence has taken place extensively in the Long Beach Harbor area. At the center of the basin, subsidence amounted to as much as 30 feet at one time. To correct this problem, a full-scale water injection operation was initiated in 1958. Extensive repressurization of the reservoir through water injection has stabilized the area, which, along with substantial remedial land fill operations, has allowed continued use of port, petroleum production and commercial facilities. The Long Beach Oil and Gas Department monitors subsidence to ensure land remains stable during oil extraction.

The Ordinance will result in the cessation of oil and gas extraction in the City of Los Angeles. While the cessation and subsequent abandonment activities that could occur would not increase potential for subsidence as they would reduce the amount of oil extracted from City oil wells, the Ordinance recognizes subsidence as a health and safety concern and includes the provision for health and safety related activities on wells as determined necessary by the Zoning Administrator. Therefore, the Ordinance would not cause a geologic unit to become unstable and impacts would be less than significant.

d) Be located on expansive soil, as defined in Table 181 B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?

*No Impact.*

The Project does not include the construction of any new structures that would have the potential to be located on expansive soil. Well abandonment activities would be required to comply with applicable CalGEM and LAFD requirements. As such, substantial direct or indirect risk to life or property would occur. No impact would occur.

e) Have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater?

*No Impact.*

---

31 City of Long Beach General Plan Program, Public Safety Element, May 1975 (reprinted 2004).
The Project does not include the construction of any new structures that would require the use of septic tanks or alternative wastewater disposal systems. No impact would occur.

f) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

No Impact.

Paleontological resources include fossil remains or traces of past life forms, including both vertebrate and invertebrate species, as well as plants. Paleontological resources are generally found within sedimentary rock formations. As described under Cultural Resources, above, although minor grading may occur during the abandonment process, such activities would be limited to previously disturbed areas where resources are unlikely to be located due to past disturbance. No excavation or previously undisturbed soils would occur as a result of the Ordinance that would have the potential to result in newly discovered resources. Therefore, no impact would occur.

VIII. GREENHOUSE GAS EMISSIONS

The following is based on the Project’s Air Quality and GHG Technical Report included as Appendix A to this Initial Study. The responses to the checklist questions below summarize the Project’s potential GHG impacts found therein. For additional details related to GHG setting, regulatory framework, assumptions, methodology, and impact analyses, please refer to Appendix A to this Initial Study.

The City’s methodology for assessing the significance of a project’s GHG impacts generally includes 1) an evaluation of a project’s potential to generate GHG emissions,
and 2) if a project does generate a net increase in GHG emissions, an evaluation if the project conflicts with an applicable plan, policy or regulation adopted for the purpose of reducing GHG emissions. Thus, because many projects in the City generate a net increase in GHG emissions, both GHG checklist questions are typically evaluated together. However, as discussed below, because the Ordinance would not have the potential to generate an increase in long-term GHG emissions, each checklist question has been evaluated individually.

a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

**Less than Significant Impact.**

Similar to the short-term and temporary air quality impact discussion provided previously (see **Air Quality** Section), activities associated with well abandonment also have the potential to generate short-term and temporary GHG emissions. Following the same assumptions utilized in the air quality impact discussion, the estimated abandonment related GHG emissions are summarized in Table 9, **Oil & Gas Well Abandonment GHG Emissions (Per Well).** Because these emissions would be short-term and temporary, they are considered one-time GHG emission sources without the potential to increase long-term and recurring GHG emissions into the future. As discussed in further detail below, long-term and recurring GHG emissions would be decreased compared to existing GHG emissions associated with oil and gas operations throughout the City as oil and gas operations cease. Although not regulated by the Ordinance, well abandonment is a reasonably foreseeable outcome for many of the wells currently operating in the City. As such, the one-time GHG emissions associated with abandonment are a necessary step in the process to achieve long-term and recurring GHG reductions from terminating oil and gas operations throughout the City.

*a While abandonment would likely occur over a short period (i.e., 10 work days), the estimate is presented in metric tons per year as this is the standard unit of measurement to describe GHG emissions.
Source: Impact Sciences, September 2022. See **Appendix A** to this Initial Study.
As oil and gas wells cease operation, existing GHG emission sources associated with oil and gas wells and long-term GHG emissions would be decreased compared to existing emissions associated with oil and gas wells throughout the City. The following discussion identifies the potential GHG emissions that may be avoided as a result of the Ordinance.

Long-term GHG emissions fall into two general categories: 1) worker commutes and 2) fugitive emissions. In general, fugitive emissions from oil and gas activities may be attributed to the following primary types of sources: fugitive equipment leaks; process venting; evaporation losses; disposal of waste gas streams (e.g., by venting or flaring), and accidents and equipment failures. Fugitive leaks from piping and equipment are typically small yet detectable emissions from equipment where there are joints, flanges, and seals. Although joints and flanges are typically bolted, small amounts of hydrocarbons may be emitted through leaky joints.

It should be noted that fugitive emissions are difficult to quantify with a high degree of accuracy and there remains substantial uncertainty in the emission factors and calculation methodologies for oil and gas activities. This is due to the numerous types of sources and many variables to be considered. The key emission assessment issues are: (a) use of simple production-based emission factors is susceptible to excessive errors; (b) use of rigorous bottom-up approaches requires expert knowledge to apply and relies on detailed data which may be difficult and costly to obtain; and (c) measurement programs are time consuming and very costly to perform. Nevertheless, Table 10, Avoided Oil & Gas GHG Emissions, has been included as a good-faith effort to illustrate the potential scope of GHG emissions that may be avoided as a result of the Ordinance. Due to the programmatic nature of this analysis and the many variables at each oil and gas well throughout the City, the quantified estimates in Table 10 are included for illustrative purposes. Furthermore, while it is clear the Ordinance would result in a net benefit to local and regional GHG emissions, the degree to which GHG emissions may be avoided under the Ordinance is not the basis for the impact determination. Because the Ordinance would reduce long-term GHG emissions compared to existing emissions associated with oil and gas wells throughout the City, the Ordinance would not generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment. Furthermore, as discussed in GHG checklist question (b) below, the Ordinance would not conflict with an applicable plan, policy or regulation adopted for the purpose of reducing GHG emissions. Therefore, this impact is less than significant.

32 Intergovernmental Panel on Climate Change, Good Practice Guidance and Uncertainty Management in National Greenhouse Gas Inventories, Fugitive Emissions From Oil and Natural Gas Activities.

33 See Appendix A to this Initial Study for further information related to calculations and assumptions utilized to prepare these estimates.

³ As described previously herein, abandonment of individual wells may occur at any time during the 20-year timeframe, and potentially beyond the 20-year timeframe. It would be speculative to assess how many wells would be abandoned during a given year, month, or peak day. Thus, the total avoided GHG emissions estimated here represents the annual metric tons per year upon abandonment of all wells.

Source: Impact Sciences, September 2022. See Appendix B to this report.

### b) Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

**Less than Significant Impact.**

As discussed in detail in the Project’s *Air Quality and GHG Technical Report* (see Appendix A to this Initial Study), AB 32 required CARB to adopt a scoping plan indicating how reductions in significant GHG sources will be achieved through regulations, market mechanisms, and other actions. In 2008, CARB released the Climate Change Proposed Scoping Plan in October 2008 that contained an outline of the proposed state strategies to achieve the 2020 greenhouse gas emission limits as outlined in AB 32. In response to SB 32, CARB adopted California’s 2017 Climate Change Scoping Plan (2017 Update), which outlines the proposed framework of action for achieving California’s SB 32 2030 GHG target: a 40 percent reduction in GHG emissions by 2030 relative to 1990 levels. The 2030 target is intended to ensure that California remains on track to achieve the goal set forth by E.O. B-30-15 to reduce statewide GHG emissions by 2050 to 80 percent below 1990 levels.

The Ordinance would be consistent with the objectives of CARB's Scoping Plan, which is intended to reduce GHG emissions in accordance with AB 32 and SB 32. The Scoping Plan provides a framework for actions to reduce California's GHG emissions and requires CARB and other state agencies to adopt regulations and other strategies to reduce GHGs. Most of these measures focus on area source emissions (e.g., energy production, distribution and usage, and high-GWP GHGs in consumer products) and changes to the vehicle fleet (i.e., hybrid, electric, and more fuel-efficient vehicles) and associated fuels.

---

(e.g., Low Carbon Fuel Standard), among others. The Ordinance would comply with all regulations adopted in furtherance of the Scoping Plan to the extent required by law and to the extent that they are applicable to the Ordinance. For example, abandonment activities will utilize equipment in compliance with regulations set forth by CARB. Mobile sources during abandonment would be subject to the requirements of California Assembly Bill 1493 (Pavley Standards), the Advanced Clean Cars Program, and the Low Carbon Fuel Standard Regulation. Additionally, while the Ordinance is not a GHG reduction plan, the Ordinance is a reflection of state, regional, and local goals to move away from reliance on oil and gas energy sources which will serve to reduce long-term GHG emissions and help the State achieve the GHG reductions mandated in AB 32 and SB 32. The State has enacted numerous legislative regulations to address climate change by reducing our dependence on fossil fuels to reduce GHG emissions. California’s Renewable Portfolio Standards established by Senate Bill 1078 requires that 60% of our electricity generation be produced from clean renewable sources by 2030 and become carbon-free by 2045. This has contributed to California’s move away from electricity powered by coal and natural gas and a progressive increase in the use of solar and wind energy sources. This has occurred for both utility scale energy generation as well as for new single-family residential uses which are required to meet their electricity needs by installing solar panels under the State’s Title 24 building standards. For passenger vehicles, Executive Order N-79-20 would ban the sales of new gasoline and diesel passenger vehicles while requiring that only new zero-emission vehicles be sold by 2035. This Executive Order is also consistent with CARB’s regulations transitioning from diesel trucks and vans to zero emission trucks, and public bus fleets to be fully electric by 2040. See also Tables 4 and 5 in the Project Description for a comprehensive list of state, regional, and City policies that support the Ordinance. Thus, because the Ordinance is consistent with state, regional, and local goals to move away from reliance on oil and gas energy sources, the Ordinance would not have the potential to conflict with an applicable plan, policy or regulation adopted for the purpose of reducing GHG emissions and this impact is less than significant.
IX. HAZARDS AND HAZARDOUS MATERIALS

Would the project:

a. Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials? ☒ ☐ ☐ ☐

b. Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment? ☒ ☐ ☐ ☐

c. Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school? ☒ ☐ ☐ ☐

d. Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would create a significant hazard to the public or the environment? ☒ ☐ ☐ ☐

e. For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area? ☒ ☐ ☐ ☐
f. Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

<table>

<td>☒</td>
</tr>
</tbody>
</table>

a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

**Less than Significant Impact.**

As defined by State law in California Code of Regulations and LAFD CUPA, hazardous wastes are any chemical wastes that are ignitable, toxic, reactive, corrosive, or carcinogen. These wastes may include waste oil, waste coolant, waste parts cleaner, used oil filters and fuel filters, dry cleaning solvents and paints. A waste or combination of wastes, which because of its quantity, concentration, or physical or chemical characteristics may either: 1) cause or significantly contribute to an increase in mortality or an increase in serious irreversible illness; or 2) pose a substantial present or potential hazard to human health or environment when improperly treated, stored, transported, or disposed of, or otherwise managed. Existing city, county, and state regulations for oil drill sites mitigate or minimize the risk that operation of these wells pose in high-risk areas. For example, the LAFD requires that all crude oil facilities submit Hazardous Material Business Plans to identify the extent of the hazardous materials and functions operated on-site. In addition, LAFD also requires a Spill Containment and Control Plan that mitigates spills both on-site and in the adjacent areas around the oil extraction site. CalGEM also conducts regular inspections of the facility to review equipment safety functions and ensure that pipelines are safely maintained. South Coast AQMD also responds to air pollution complaints and has safety standards for specific pieces of equipment that carry the risk of emitting specific odors and that may pose hazards to the workers and local vicinity.

The termination of oil extraction activities would reduce the potential for risk to the public through routine transport, use or disposal of hazardous materials such as petroleum, as extraction would no longer occur citywide. Well abandonment uses materials such as, but
not limited to, cement, bentonite, and various drilling fluids reviewed by the California Department of Conservation’s CalGEM division. Therefore, the processing and handling of these materials would be conducted in accordance with the regulatory compliance measures that exist under the jurisdictions of the California Code of Regulations, LAFD CUPA, and CalGEM. Impacts would be less than significant; no mitigation is required.

b) **Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?**

*Less than Significant Impact.*

**Methane**

Methane (CH₄) is a naturally occurring, odorless, colorless, and extremely flammable gas with a wide distribution in nature. It is the major constituent of natural gas that is used as a fuel and is an important source of hydrogen and a wide variety of other organic compounds. It is often found in conjunction with petroleum deposits. No long-term health effects are known to occur from exposure to methane. However, at very high concentration, methane can act as an asphyxiate by reducing the relative concentration of oxygen in the air that is inhaled (similar to carbon monoxide). The primary danger posed by methane build-up (specifically when within confined spaces) is the risk of fire or explosion.

Methane levels in the local atmosphere are monitored by the CARB and SCAQMD, and are measured in parts per million, or ppm. Normal background is approximately 2 ppm. Results greater than 3 ppm suggest some additional sources of methane, and results greater than 10 ppm suggest a considerable additional amount of methane is present.³⁵

The termination of oil extraction activities would reduce the potential for upset and accident conditions associated with oil extraction citywide. Once a well is undergoing abandonment operations, CalGEM would monitor and enforce required methane safety protocols, and CARB and the SCAQMD would measure methane concentrations at the surface around the well. In addition, air measurements would be taken using downwind airplane flights shortly after the well is controlled in order to estimate the leak rate. All of these measurements will indicate whether methane and associated compounds currently are abating due to a successful seal of the well. Some amount of residual methane is expected to seep out of the ground around the leaking well after the well is successfully sealed. In keeping with current policy, the area would continue to be monitored by CARB.

---

and SCAQMD to ensure that methane levels remain below the 3 ppm threshold. In the event that methane levels above the acceptable threshold are identified, both CARB and SCAQMD have the jurisdiction to enforce air pollution regulations related to oil drilling and production and methane emissions. Both agencies have the right to conduct inspections of air pollution sources, and the right to issue a Notice to Comply (NC), requiring a facility to quickly correct a minor violation or to provide specified records, or a Notice of Violation (NOV), formally identifying a violation of particular rules or regulations, which may result in civil penalties or, in some cases, referral for criminal prosecution.

Worker exposure to methane is regulated by the OSHA under CFR section 1910.146. This section regulates worker exposure to a ‘hazardous atmosphere’ within a confined space where the presence of flammable gas vapor or mist is in excess of 10 percent of the lower explosive limit.

Chapter IX, Article 1, Division 71, Section 91.7103 of the LAMC, also known as the Los Angeles Methane Seepage Regulations, identifies Methane Hazard Zones and Methane Buffer Zones. Oil and gas wells may be located within a Methane Hazard Zone, as designated by LADBS. Due to the potential environmental risk associated with Methane Hazard Zones, properties within a Methane Hazard Zone require methane testing and mitigation upon redevelopment. As implementation of the Oil Ordinance would not involve the redevelopment of any of the oil well sites, no action related to methane zones would be necessary.

Future well abandonments that may occur as a result of the Ordinance would be subject to the regulations and standards established by local and state agencies such as CalGEM’s statutory oil well abandonment requirements. Compliance with these requirements will ensure risk due to upset or accident conditions involving the release of hazardous materials would be minimized. Additionally, the proposed Ordinance would not allow new development or expansion of oil operations that would otherwise have a potential to create impacts and would reduce the number of operating wells, thereby reducing the potential for future accidents. Therefore, impacts to releasing hazardous materials into the environment would be less than significant, no mitigation is required.

c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

*Less than Significant Impact.*

Due to the pervasive nature of oil wells in the City, wells are known to operate within ¼-mile of existing schools. The Ordinance provides for the termination of all nonconforming oil uses over a 20-year amortization period. The cessation of oil extraction would result in a decrease in the number of wells operating near school sites, thereby reducing potential risk. Future well abandonments would be subject to the regulations and standards established by local and state agencies such as CalGEM’s statutory oil well abandonment requirements. Additionally, the proposed Ordinance would not allow new development or expansion of oil operations that would otherwise have a potential to create impacts.

All potentially hazardous materials transported, stored, or used on individual well sites for abandonment activities would be contained, stored, and used in accordance with manufacturers’ instructions and handled in compliance with applicable standards and regulations. All abandonment activities would be required to comply with all federal, state and local standards and regulations. Therefore, the abandonment activities that occur as a result of the Ordinance are not expected to adversely affect existing schools in and around the abandonment sites. Impacts would be less than significant, and no mitigation is required.

d) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

*Less than Significant with Mitigation Incorporated.*

California Government Code Section 65962.5, commonly referred to as the “Cortese List,” requires various State agencies, including but not limited to, the Department of Toxic Substances Control (DTSC) and the SWRCB, to compile lists of hazardous waste disposal facilities, unauthorized releases from underground storage tanks, contaminated drinking water wells and solid waste facilities where there is known migration of hazardous waste and submit such information to the Secretary for Environmental Protection on at least an annual basis.

*These lists include, but are not limited to, the ‘EnviroStor’* ([http://www.envirostor.dtsc.ca.gov/public/](http://www.envirostor.dtsc.ca.gov/public/)) *and ‘GeoTracker’* ([http://geotracker.waterboards.ca.gov/](http://geotracker.waterboards.ca.gov/)) *lists maintained by the DTSC and the SWRCB, respectively.*
As described in the Project Description, many of the oil drilling sites are within M3 zones. M3 zones are heavy industrial zones that allow for uses such as cargo container storage, junk yards and scrap metal processing. These uses are commonly contained on the Cortese List. Due to the limited data available regarding the exact location of oil and gas wells within M3 zones, there is overlap between the wells and other properties on the Cortese List. Nonetheless, it is reasonable to assume many of the wells in M3 zones are also on the Cortese List. In addition to wells in the M3 zone, other wells are also believed to be located on the Cortese List.

The Ordinance would require the cessation of oil and gas extraction Citywide, including on any sites that are known to be on the Cortese List. The cessation of oil and gas extraction would not create a significant hazard to the public or the environment and instead would have a beneficial effect of reducing air quality and GHG emissions (See Air Quality, GHG). As described in a) through c) above, all abandonment activities would be completed in accordance with CalGEM and LAFD requirements thereby ensuring no risk to the public would occur. However, due to the high likelihood that soil contamination exists at many of the well sites as a result of their location on the Cortese List, additional mitigation is required. Mitigation Measure HAZ-1 would require prior to abandonment, the well owner to review the Cortese List to determine if the subject well is on the list. If it is found that the subject well (or grouping of wells) is on the list, a Phase I Environmental Site Assessment (ESA) should be conducted to determine the level of contamination. Compliance with recommendations in the Phase I ESA would reduce potential impacts to below a level of significance.

Lastly, it would be speculative to determine any future use that might occur on these sites. At the time when any well sites are considered for redevelopment, including well sites in M3 zones or located on Cortese List, those actions would undergo additional environmental review in accordance with CEQA. With implementation of HAZ-1, impacts are considered less than significant.

**MM HAZ-1** For well sites in which the abandonment process requires grading and are:

- Located on or within 500 feet of a Hazardous Materials site listed in any of the following databases:
  - State Water Resources Control Board GeoTracker (refer to https://geotracker.waterboards.ca.gov);
  - DTSC EnviroStor (refer to https://www.envirostor.dtsc.ca.gov/public);
  - DTSC Hazardous Waste Tracking System (refer to https://hwts.dtsc.ca.gov);
- LAFD Certified Unified Program Agency (refer to the active, inactive, and historical inventory lists at https://www.lafd.org/fire-prevention/cupa/public-records);

- Los Angeles County Fire Department Health Hazardous Materials Division (refer to the active and inactive facilities, site mitigation, and California Accidental Release Prevention inventory lists at https://fire.lacounty.gov/public-records-requests);

- SCAQMD Facility Information Detail (refer to https://xappprod.aqmd.gov/find); or

  - Located on or within 500 feet of a Hazardous Materials site designated as a Resource Conservation and Recovery Act (RCRA) Small Quantity Generator or Large Quantity Generator (refer to the U.S. EPA Envirofacts database at https://enviro.epa.gov/index.html);

  And:

  - The site has not been previously remediated to the satisfaction of the relevant regulatory agency/agencies for any contamination associated with the above uses or site conditions.

Then a Phase I Environmental Site Assessment shall be prepared by a Qualified Environmental Professional in accordance with State standards/guidelines and current professional standards, including the American Society for Testing and Materials' (ASTM) Standard Practice for Environmental Site Assessments, to evaluate whether the site, or the surrounding area, is contaminated with hazardous substances from any past or current land uses, including contamination related to the storage, transport, generation, or disposal of toxic or Hazardous Waste or materials.

If the Phase I identifies a Recognized Environmental Condition (REC) and/or if recommended in the Phase I, a Phase II Environmental Site Assessment shall also be prepared by a Qualified Environmental Professional. The Phase I and/or Phase II Environmental Site Assessment(s) shall be maintained pursuant to appropriate proof of compliance and made available for review and inclusion in the administrative record by the appropriate regulatory agency, such as the State Water Resources Control Board, the State Department of Toxic Substances Control, or the LAFD Hazard Mitigation Program. Any remediation plan recommended in the Phase II Environmental Site Assessment or by the appropriate regulatory agency to ensure the abandonment process does not exacerbate existing identified hazardous conditions shall be implemented and, if required, a No Further Action letter, or equivalent, shall be issued by the appropriate regulatory agency prior to issuance of any permit from LADBS, unless the regulating agency determines that remedial action can be implemented in conjunction with excavation and/or grading. If oversight or approval by a regulatory agency is not required, the Qualified Environmental Professional shall provide written verification of compliance.
with and completion of the remediation plan, such that the site meets the applicable standards for the proposed use, which shall be maintained pursuant to appropriate proof of compliance requirements.

e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area?

*Less than Significant Impact.*

Three airports are located within the City of Los Angeles: two public and one general aviation, respectively they are: Los Angeles International (LAX) and Van Nuys, and Whiteman Airport. There are three inactive plugged wells located within one mile of LAX. However, the Project does not include the construction of any new structures that could interfere with existing flight paths. The Ordinance will not result in a safety hazard for any people residing or working in a project area located within an airport land use plan, within two miles of an airport or in the vicinity of a private airstrip. Noise impacts from abandonment operations would also be less than significant, no mitigation is required – refer to the analysis in Section XIII. NOISE, below.

f) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

*Less than Significant Impact.*

Emergency services in the City are provided by the LAFD and the City of Los Angeles Police Department (LAPD). Emergency incidents of a larger natural or manmade disaster require coordinated efforts between the LAFD, LAPD and the City’s Emergency Operation Center (EOC). The EOC is the focal point for coordination of the City’s emergency planning, training, response and recovery efforts. EOC processes follow the National All-Hazards approach to major disasters such as fires, floods, earthquakes, acts of terrorism and large-scale events in the City that require involvement by multiple City departments.

Implementation of the Ordinance would not require or result in permanent modifications to roadways that would impact emergency access. The Ordinance would not result in changes to existing policies, programs, or regulations that address emergency response. Abandonment of oil wells that occurs after cessation of well operation would be reviewed by the LAFD and LAPD to ensure that abandonment operations conform to all applicable regulations (including those applicable to construction related traffic) that address emergency response and access, including the LAFD Fire Code requirements.
While intermittent road closures could occur as a result of abandonment operations, it is not anticipated that such closures would result in substantial delays to service providers. Any lane closures must be approved by LADOT and they would not be approved if substantial delays could result. Typically, LADOT will require a construction traffic management plan, including use of flag personnel to help direct traffic around any roadway closures. Therefore, impacts related to emergency response and access as a result of the Ordinance would be less than significant, no mitigation is required.

g) **Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires?**

*No Impact.*

There are currently 21 active wells and 2 idle wells located in the City’s designated Very High Fire Hazard Severity Zone. The Ordinance would not result in any new permanent and/or habitable structures in these zones that could exacerbate fire risk. Maintained brush clearance and defensible space requirements are and will continue to be required in accordance with LAFD protocols. Therefore, activities associated with termination and future abandonment would not impact state responsibility areas or lands classified as very high fire hazard severity zones. No impacts regarding wildfire risks or related post-fire conditions would occur.

**X. HYDROLOGY AND WATER QUALITY**

<table>

Would the project:

a. **Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality?**

b. **Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?**
c. Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:

   i. Result in substantial erosion or siltation on- or off-site;
   
   ii. Substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site;
   
   iii. Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or
   
   iv. Impede or redirect flood flows?
   
   d. In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation?
   
   e. Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?

   a) Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or groundwater quality?

   No Impact.

The purpose of the Ordinance is to terminate existing oil extraction in the City. The termination of extraction activities would have no impact on water or groundwater. Future well abandonment that subsequently may occur would not involve demolition of existing structures, which may instead take place as part of any remediation, which is outside the
scope of this analysis. Internal roads, access ways and storm water retention and other drainage features and facilities shall remain in place. Because no changes would occur regarding water quality standards, waste discharge requirements or otherwise impact surface or ground water quality, implementation of the Ordinance would not have any impacts related to water quality standards, waste discharge requirements or surface or ground water quality. No impact would occur.

b) Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?

No Impact.

Cessation of well operations would not require the use of groundwater, nor would any change in impervious surface occur that could result in interference with groundwater recharge. Well abandonment activities may require water to plug the wells, however, such water usage would be a one-time use and would not be substantial such that it would interfere with groundwater management. As such, these activities would not result in a decrease in groundwater supplies and would not interfere with groundwater recharge. No impact would occur.

c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:

i. Result in substantial erosion or siltation on- or off-site;

ii. Substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site;

iii. Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or

iv. Impede or redirect flood flows?

No Impact.

Cessation of well operations would not alter drainage patterns. Future well abandonment that may occur subsequent to the Ordinance would not involve any changes to, or demolition of existing drainage infrastructure. Internal roads, access ways and storm water retention and other drainage features and facilities shall remain in place. No changes would occur to the course of any existing stream or river, and as previously
discussed, there would be no addition to impervious surfaces. Abandonment operations would not result in the substantial alteration of drainage patterns resulting in erosion or siltation on- or off-site, increase the rate of surface water runoff exceeding the capacity of stormwater and flood management resources or substantial polluted runoff, or impede or redirect flood flows. All existing stormwater retention facilities and other storm water retention and drainage features and facilities will remain in place. No impact would occur.

d) In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation?

No Impact.

Cessation of well operations and potential future abandonment of wells would not involve any changes to, or demolition of existing drainage infrastructure. Internal roads, access ways and storm water retention and other drainage features and facilities shall remain in place. While some of the existing wells may be located within in flood hazard, tsunami, or seiche zones, activities related to abandonment would not increase the risk of release of pollutants involving flooding or inundation as all wells would be required to be properly abandoned in accordance with CalGEM requirements. No impact would occur.

e) Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?

No Impact.

As described in X (a) through (d) well cessation that would occur as a result of the Ordinance, and subsequent abandonment of wells would not have an adverse impact on water quality or groundwater. Subsurface activities would involve the plugging of existing and excavated well boreholes with cement, mud and soil. Previously disturbed areas will not involve new excavations or deepening of existing excavations and will not involve the handling or release of hazardous materials. Well plugging under the supervision of CalGEM is designed to protect aquifer zones. All materials removed from the oil well abandonment and abandonment operations area will be disposed of in compliance with all applicable laws and regulatory requirements. No impact would occur.
XI. LAND USE AND PLANNING

Would the project:

a. Physically divide an established community?

☐ Potentially Significant Impact  ☐ Less Than Significant Impact with Mitigation Incorporated  ☒ Less Than Significant Impact  ☐ No Impact

b. Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?

☐ Potentially Significant Impact  ☐ Less Than Significant Impact with Mitigation Incorporated  ☒ Less Than Significant Impact  ☐ No Impact

a) Physically divide an established community?

No Impact.

The purpose of the Ordinance is to terminate oil extraction in the City. No new permanent structures would be constructed as part of the Project. As such, the Ordinance would not result in the physical division of an established community.

b) Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?

Less than Significant Impact.

The L.A. CEQA Thresholds Guide 2006\textsuperscript{38} addresses consistency with plans:

\begin{quote}
For conflicts with environmental goals and policies, consider whether the project would interfere with the City's efforts to meet such goals, or be inconsistent with adopted policies.
\end{quote}

To determine the Project's potential to conflict with adopted policies, the following City plans were reviewed: Conservation Element of the General Plan, West Adams-Baldwin Hills-Leimert Community Plan, Harbor Gateway Community Plan (2022 Draft), Air Quality Element, A Healthy Plan for Los Angeles, Safety Element, L.A.'s Green New Deal,

Wilmington Harbor City Community Plan (2022 Draft). Table 4 in the Project Description provides the relevant policies for each of the plans.

As is shown in the Table, the vast number of these policies recognize the negative health and safety implications of locating oil wells in proximity to residential uses. Further, as can be seen in the table, the City has adopted numerous policies over the last 20 years that encourage either increased management of or termination of oil drilling, including:

- **Policy LU75-1 Discretionary Review.** Seek a high level of discretionary review for any changes to, or expansion of, existing oil extraction sites and activities so that the public may remain informed and involved, and so that appropriate environmental review may take place pursuant to the California Environmental Quality Act. (West Adams-Baldwin Hills-Leimert Community Plan)

- **Policy 2:** continue to support state and federal bans on drilling in the Santa Monica Bay and on new drilling along the California coast in order to protect the San Pedro and Santa Monica bays from potential spills associated with drilling, extraction and transport operations. (Conservation Element)

- **Coordinate with L.A. County to develop a sunset strategy for oil and gas production operations** (L.A. Green New Deal)

- **Reduce oil production by 40% below 2013 levels**

- **1.2.1 Environmental Justice.** In keeping with the Plan for a Healthy LA, build a fair, just and prosperous city where everyone experiences the benefits of a sustainable future by correcting the long running disproportionate impact of environmental burdens faced by low-income families and communities of color. (Safety Element)

- **5.4 Protect communities’ health and well-being from exposure to noxious activities** (for example, oil and gas extraction) that emit odors, noise, toxic, hazardous, or contaminant substances, materials, vapors, and others. (A Plan for a Healthy Los Angeles)

The Ordinance is consistent and does not conflict with the policies identified in Table 4, including the policies set forth above, as it would require the termination of oil and gas extraction in the City. The Ordinance is consistent with current City goals and policies, shown above, that encourage buffers from active wells and call for a transition toward green energy sources such as renewable solar. The Ordinance will help further the goals of the General Plan Health, Wellness and Equity Element, as it seeks to protect community health and wellbeing from exposure to noxious activities, specifically oil and
gas extraction, that emit odors, noise, toxic, hazardous, or contaminant substances, materials, vapor and others.39

Cessation of oil and gas extraction activities is consistent with the above polices as it would not interfere with the City’s effort to meet such goals and polices and would instead help to further the stated goals and polices. Therefore, the Ordinance does not have the potential to result in any significant impacts due to conflict with existing plans and policies, as no conflict would occur. Impacts would be less than significant, and no mitigation is required.

XII. MINERAL RESOURCES

<table>

<tr>
<td>☒ Potentially Significant Impact ☐ Less Than Significant with Mitigation Incorporated ☐ Less Than Significant Impact ☐ No Impact</td>
</tr>
</tbody>
</table>

Less than Significant Impact.

The City of Los Angeles General Plan provides growth and development policies by providing a comprehensive long-range view of the City as a whole. The Conservation Element of the General Plan consists of an identification and analysis of the existing natural resources in the City of Los Angeles.

---

39 Health, Wellness and Equity Element “Plan for a Healthy Los Angeles”, page 95 Section 5.4 Noxious activities, available on the City’s website at: https://planning.lacity.org/odocument/2442d4df-34b3-4683-8eb9-b5ea1182782b/Plan_for_a_Healthy_Los_Angeles.pdf
Policies of the Safety and Conservation Element include the preservation of mineral resources and of the access to these resources:

- Policy 1: Continue to encourage energy conservation and petroleum product reuse
- Policy 3: Continue to protect neighborhoods from potential accidents and subsidence associated with drilling, extraction, and transport operations, consistent with California Department of Conservation, Division of Oil and Gas requirements

The Health Element includes the following policy related to oil extraction:

- 5.4 Protect communities’ health and well-being from exposure to noxious activities (for example, oil and gas extraction) that emit odors, noise, toxic, hazardous, or contaminant substances, materials, vapors, and others. (A Plan for a Healthy Los Angeles)

The Safety Element includes the following policies regarding energy usage:

- 1.2.2 Renewable Energy. Aggressively pursue renewable energy sources, transitioning away from fossil based sources of energy and toward 100% renewable energy sources.
- 1.2.7 Zero Emissions Vehicles. In keeping with the Mobility Plan, work toward zero emissions transportation and goods movement and increase zero emissions infrastructure including charging.

As stated in XI Land Use, numerous other policies have been adopted by the City over the last several years that support limitations such as setbacks on oil wells and encourage a move away from petroleum at the City level. Each of these policies signal a long-term shift away from petroleum to renewables and electricity. As such, while the 2001 Conversation Element provides a map of the various oil fields in the City and discusses petroleum as a resource, the City does not consider petroleum to be a mineral resource of local importance and considers the activities associated with its extraction to be detrimental to public health, safety, and the environment. This is reflected in recent City initiatives and ordinances such as the Green New Deal, Clean Up Green Up (LAMC 13.18 eff. June 2016) and in policies included in the updates to the Health and Safety elements of the City's General Plan adopted on November 24, 2021, including Health Element policy 5.4 and Safety Element policies 1.2.2 and 1.2.7. Furthermore, this Ordinance is consistent with Conservation Element, Section 19 policies 1 and 3 to “encourage conservation of petroleum,” and to “protect neighborhoods from potential accidents and subsidence associated with [petroleum] drilling, extraction and transport operations...”
As previously stated, the annual cumulative oil production in 2017 in the City was two percent of the state's total production. This represents a small amount of the available Statewide resource. As State and national policies also shift away from petroleum the value of the resource continues to diminish. Therefore, termination of oil and gas extraction would not represent the loss of a mineral resource that would be of value to the region and the residents of the state. Impacts would be less than significant and no mitigation is required.

b) Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?

Less than Significant Impact.

As described under XII(a) above, petroleum is no longer considered an important mineral resource at the local level. This shift is evidenced in the numerous goals and policies adopted by the City over the last 20 years that support a move away from petroleum in favor of renewable energy and electricity (See Tables 4 and 5 in the Project Description). Further, as the health impacts associated with oil and gas extraction have been made clear, the City has moved toward prioritizing the health and safety of residents over oil and gas extraction. In particular, the Ordinance will help further the goals of the General Plan Health, Wellness and Equity Element “Plan for a Healthy Los Angeles” adopted in November 2021 (Health Element), as it seeks to “protect communities” health and wellbeing from exposure to noxious activities (for example oil and gas extraction) that emit odors, noise, toxic, hazardous, or contaminant substances, materials, vapor and others.”40 The Ordinance represents another example of the City implementing its more current goals and policies that call for a transition away from oil and gas uses. For the reasons stated above, these mineral resources are no longer considered locally important, therefore, impacts would be less than significant and no mitigation is required.

XIII. NOISE

The following is based on the Project’s Noise and Vibration Technical Report included as Appendix B to this Initial Study. The responses to the checklist questions below summarize the Project’s potential impacts found therein. For additional details related to noise and vibration setting, regulatory framework, assumptions, methodology, and impact analyses, please refer to Appendix B to this Initial Study.

40 Health, Wellness and Equity Element “Plan for a Healthy Los Angeles”, page 95 Section 5.4 Noxious activities, available on the City’s website at: https://planning.lacity.org/odocument/2442d4df-34b3-4683-8eb9-b5ea1182782b/Plan_for_a_Healthy_Los_Angeles.pdf
Would the project result in:

a. Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

- ☐ Potentially Significant Impact
- ☒ Less Than Significant with Mitigation Incorporated
- ☐ Less Than Significant Impact
- ☐ No Impact

b. Generation of excessive groundborne vibration or groundborne noise levels?

- ☐ Potentially Significant Impact
- ☐ Less Than Significant with Mitigation Incorporated
- ☒ Less Than Significant Impact
- ☐ No Impact

c. For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

- ☐ Potentially Significant Impact
- ☐ Less Than Significant with Mitigation Incorporated
- ☐ Less Than Significant Impact
- ☒ No Impact

\textbf{Less than Significant with Mitigation Incorporated.}

\textbf{Short-Term and Temporary Noise}

The closure of oil and gas wells entails plugging the wells in place in accordance with California Statutes and Regulations and all other applicable requirements as overseen by CalGEM. The process of well abandonment will be determined on a case-by-case basis under the regulatory supervision of CalGEM and the LAFD and will depend on individual site conditions such as type and depth of well. However, for the purposes of this environmental analysis, several generalized assumptions have been made based upon standard industry practice, existing regulations governing well abandonment, and case studies. While plugging and abandonment varies by well, there is a consistent set of procedures that are followed. Generally, the drill site’s existing drilling or maintenance rig
will be used to abandon the well and remove equipment from the well. Well equipment will be removed from the site by truck. Cement trucks will also arrive onsite to fill the well at various depths over a span of several days. An operator may use in excess of 2,500 cubic feet of cement for one abandonment. The process entails removing equipment and filling the well with cement at different phases in order to ensure that it is safe to abandon the well at varying depths. At the end of each work day, the well site is closed and the rig is shut down in order to resume operations the following work day. See the Project Description for the anticipated steps of well abandonment.

For purposes of estimating potential noise and vibration levels associated with abandonment activities, it is assumed each well abandonment would last approximately two weeks (i.e., 10 work days), and on-site equipment would include one workover rig, one cement pump truck, one welder, and one tractor/loader/backhoe. This analysis conservatively assumes that all pieces of equipment would operate concurrently, presenting a worst-case impact scenario.

The Federal Highway Administration’s (FHWA) Roadway Construction Noise Model (RCNM) has compiled data regarding the noise-generating characteristics of specific types of construction equipment and typical construction activities. With the use of the RCNM, as detailed in Appendix B to this Initial Study, the short-term and temporary noise levels associated with abandonment activities are presented in Table 11, Temporary Noise Levels During Well Abandonment - Unmitigated. As shown in Table 11, noise levels were estimated at distances of up to 50 feet, 75 feet and 100 feet to characterize potential noise levels that may be experienced at sensitive receptors located in proximity to oil and gas wells throughout the City. Noise levels would diminish notably with distance from the site at a rate of 6 dB(A) per doubling of distance (noise from stationary or point sources is reduced by about 6 dB(A) for every doubling of distance at acoustically hard locations). For example, a noise level of 86 dB(A) Leq measured at 50 feet from the noise source to the receptor would decline to 80 dB(A) Leq at 100 feet from the source to the receptor and fall by another 6 dB(A) Leq to 74 dB(A) Leq at 200 feet from the source to the receptor. These noise attenuation rates assume a flat and unobstructed distance between the noise generator and the receptor. Intervening structures and vegetation would further attenuate (reduce) the noise. Furthermore, it should be noted that increases in noise levels at sensitive receptors during abandonment would be intermittent and temporary and would not generate continuously high noise levels.

---

41 When a drilling or maintenance rig is not on the well site, a rig will need to be brought to the site to complete the abandonment process.
Table 11
Temporary Noise Levels During Well Abandonment - Unmitigated

Source: Impact Sciences, Inc., September 2022. See Appendix B to this Initial Study.

Short-term and temporary impacts would be potentially significant if, as indicated in LAMC Section 112.05, noise from construction equipment within 500 feet of a residential zone exceeds 75 A-weighted decibels (dBA) at a distance of 50 feet from the noise source. Although not required in the LAMC, this analysis also applies this LAMC standard for non-residentially zoned sensitive receptors located in proximity to oil and gas wells throughout the City. It should also be noted that the LAMC noise limitation does not apply where compliance is technically infeasible. Technically infeasible means that the above noise limitation cannot be complied with despite the use of mufflers, shields, sound barriers and/or any other noise reduction device or techniques during the operation of the equipment. As shown in Table 11, the estimated unmitigated temporary noise levels could exceed the 75 dBA noise standard at distances of up to 50 feet from the source, and unmitigated noise levels would not exceed the 75 dBA noise standard at distances of up to 75 feet and 100 feet from the source. As noise levels would diminish with distance from the source, unmitigated noise levels at distances beyond 100 feet from the source would not have the potential to exceed the noise standard. Nevertheless, as the estimated unmitigated temporary noise levels could exceed the 75 dBA noise standard at distances of up to 50 feet from the source, this impact is considered potentially significant.

Mitigation Measures

MM NOI-1: Where well abandonment activities occur within 50 feet of the following sensitive receptors: schools, day cares, elder care facilities, adult residential facilities, parks, hospitals, or residences, flexible sound control curtains shall be erected between the noise-producing equipment and the sensitive receptors, blocking the line-of-sight between the sources and receptors. The sound control curtain materials shall meet a minimum Sound Transmission Class (STC) 20 rating, capable of reducing equipment noise by at least 5 dBA.
Level of Significance after Mitigation

The use of flexible sound control curtains, as required in Mitigation Measure NOI-1, would be feasible and effective at reducing short-term and temporary noise levels at sensitive receptors located within 50 feet of well abandonment activities. The STC-20 rating identified in Mitigation Measure NOI-1 requires the sound control curtain material to have a transmission loss (TL) value of 20 dB. TL is defined as the loss in sound energy, expressed in decibels, as sound passes through a barrier or a wall.42 According to FHWA Noise Barrier Design Handbook, the design feasibility of a sound barrier that reduces noise by 5 dBA is considered “simple” and a reduction of up to 10 dBA as “attainable.”43 Thus, the data suggests that Mitigation Measure NOI-1 could reduce noise levels by up to 10 to 20 dBA. However, this analysis conservatively assumes that a 5 dBA reduction would be achieved with the implementation of Mitigation Measure NOI-1. As shown in Table 12, Temporary Noise Levels During Well Abandonment - Mitigated, Mitigation Measure NOI-1, would ensure temporary noise levels would not exceed the LAMC standard of 75 dBA at 50 feet from the source.

*Source: Impact Sciences, Inc., September 2022. See Appendix B to this Initial Study.*

Other noise best practices would be implemented during the abandonment process. These best practices would also help to reduce temporary noise levels in accordance with LAMC Section 112.05. For example, abandonment activities would be scheduled so as to avoid operating several pieces of equipment simultaneously (as feasible), which causes high noise levels. Further, noise and groundborne vibration activities whose specific location on or near the site are flexible (e.g., stationary equipment and truck idling) will be conducted as far as possible from the nearest noise- and vibration-sensitive land uses. However, given the fluid dynamics likely to occur during the abandonment processes, this analysis conservatively does not take any quantified reduction associated

---

43 FHWA Noise Barrier Design Handbook, Table 4, July 14, 2011.
with these techniques. Additionally, all abandonment activities that occur as a result of the Ordinance would be conducted in accordance with LAMC Section 41.40, which prohibits construction between the hours of 9:00 p.m. and 7:00 a.m. Monday through Friday, 6:00 p.m. and 8:00 a.m. on Saturday, and at any time on Sunday (i.e., construction is allowed Monday through Friday between 7:00 a.m. to 9:00 p.m.; and Saturdays and National Holidays between 8:00 a.m. to 6:00 p.m.). Thus, all activities generating temporary noise levels would be limited to the less noise-sensitive daytime hours. Based on these reasons, and with the implementation of Mitigation Measure NOI-1, the Ordinance would not result in the generation of a substantial temporary increase in ambient noise levels in excess of standards established in the local general plan or noise ordinance. As such, temporary noise impacts would be less than significant.

**Long-Term Noise**

As discussed in the Project’s *Noise and Vibration Technical Report* (see Appendix B to this Initial Study), existing oil and gas well operations contribute to the ambient noise levels at receptors in proximity to active wells and throughout the City as a whole. The types of noise associated with oil and gas operations can be complex in nature, due to a wide variety of sources. Some of these noises are intermittent, some are continuous, and many vary in their intensity. Certain sources, such as compressor stations, produce low frequency noise (LFN), which is typically heard as a low rumble. There are also numerous source-dependent and subjective factors that may influence health outcomes, such as noise sensitivity and noise reduction technologies employed at specific locations. As shown in Table 3 of the Project’s *Noise and Vibration Technical Report* (see Appendix B to this Initial Study), average noise levels from oil and gas production activities range from approximately 58 dBA to 90 dBA, depending on the activity and setback distances. In addition to these noise sources, other existing noise sources associated with well operations throughout the City include operator worker trips (i.e., motor vehicle noise) to and from well locations, and well maintenance related activities (i.e., fire clearance per LAFD and operations maintenance/inspections per CalGEM and other agency requirements). Upon full implementation of the Ordinance, noise sources associated with oil and gas production would be removed within the City, and long-term noise levels would likely be decreased compared to existing noise levels associated with oil and gas production. As such, the Ordinance would not result in the generation of a substantial permanent increase in ambient noise levels in excess of standards established in the
local general plan or noise ordinance, and long-term noise impacts would be less than significant.

b) Generation of excessive groundborne vibration or groundborne noise levels?

Less than Significant Impact.

Similar to the short-term and temporary noise discussion provided above, activities associated with well abandonment also have the potential to generate short-term and temporary groundborne vibration levels at sensitive receptors located in proximity to the wells. Based on the parameters described previously and guidance from the FTA’s Transit Noise and Vibration Impact Assessment Manual,44 groundborne vibration levels associated with abandonment activities are presented in Table 13, Temporary Vibration Levels During Well Abandonment. As shown in Table 13, groundborne vibration levels were estimated at distances of up to 50 feet, 75 feet and 100 feet to characterize potential vibration levels that may be experienced at sensitive receptors located in proximity to oil and gas wells throughout the City. Table 13 illustrates that short-term and temporary vibration levels would not have the potential to exceed Caltrans’ standards for building damage (PPV) or the FTA’s standards for human annoyance (VdB). As such, the Ordinance would not result in the generation of excessive groundborne vibration levels, and these impacts would be less than significant.

---

c) For a project located within the vicinity of a private airstrip or an airport land use plan, or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

*No Impact.*

Three airports are located within the City of Los Angeles: two public and one general aviation. Respectively, they are: Los Angeles International (LAX) and Van Nuys, and Whiteman Airport. There are three inactive plugged wells located within one mile of LAX. As these wells are plugged (i.e., no oil and gas extraction occurring), there would be no changes to the existing conditions at these locations. Thus, the Ordinance would not expose people residing or working in the area of oil wells to excessive noise levels associated with a private airstrip or public use airport. No impact would occur.

**XIV. POPULATION AND HOUSING**

<table>
<thead>
<tr>
<th>Would the project:</th>
<th>Potentially Significant Impact</th>
<th>Less Than Significant Impact with Mitigation Incorporated</th>
<th>Less Than Significant Impact</th>
<th>No Impact</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. Induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?</td>
<td>☐</td>
<td>☐</td>

<td>☒</td>
</tr>
<tr>
<td>a) Induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?</td>
<td>☐</td>
<td>☐</td>
<td>☐</td>
<td>☒</td>
</tr>
</tbody>
</table>

*No Impact.*

The purpose of the Ordinance is to terminate oil extraction in the City. No new permanent structures would be constructed as part of the Project. The Ordinance does not regulate redevelopment of any well sites, as such analysis of future land uses that may induce population growth would be speculative at this time. As such, the Ordinance would not
result in unplanned population growth either directly (by proposing new homes or businesses) or indirectly (through new infrastructure).

b) Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?

*No Impact.*

The Ordinance pertains to the termination of oil and gas drilling uses citywide and would not involve changes to any existing residential land uses. It would not displace any residents, remove existing housing, or necessitate the construction of replacement housing elsewhere. Therefore, no impacts would occur.

XV. PUBLIC SERVICES

Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services:

<table>
<thead>
<tr>
<th>Public Service</th>

<td>☐</td>
<td>☒</td>
<td>☐</td>
</tr>
<tr>
<td>e. Other public facilities?</td>
<td>☐</td>
<td>☐</td>
<td>☒</td>
<td>☐</td>
</tr>
</tbody>
</table>

Less than Significant Impact.
The Ordinance pertains to the termination of oil and gas drilling uses citywide and would not involve changes to any existing land uses or the construction of any residential or commercial uses which might generate needs for additional public services. The Project will not result in substantial adverse impacts related to the provision of public services, including fire, police, schools, parks or other public facilities and would not require the construction or physical alteration of any government facility providing public services. The Ordinance does not change the existing City zoning or General Plan designations for the well sites and, therefore, changes to land uses or population densities that determine the demand for public services would remain unchanged.

LAFD oversees some well maintenance and well abandonment activities, and as such, there will be a need for inspections at sites as wells are abandoned. However, LAFD is currently performing this work and the cessation of oil drilling would not place additional demand on the LAFD as well abandonment would occur incrementally over the 20 year (or more) amortization period. Further, as wells are abandoned and the number of active well sites decreases, demand on LAFD personnel would be reduced. Impacts related to public services including police and fire protection, schools, parks or libraries would be less than significant, no mitigation is required.

**XVI. RECREATION**

<table>

</tbody>
</table>
d. Result in inadequate emergency access?

☐ Potentially Significant Impact ☐ Less Than Significant with Mitigation Incorporated ☒ Less Than Significant Impact ☐ No Impact

a) Conflict with a program, plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities?

No Impact.

In general, transportation policies or standards adopted to protect the environment are those that support multi-modal transportation options and a reduction in VMT. Conversely, a project would not be shown to result in an impact merely based on whether a project would not implement a particular program, plan, policy, or ordinance. Many of these programs must be implemented by the City itself over time, and over a broad area, and it is the intention of this threshold test to ensure that proposed development projects and plans do not preclude the City from implementing adopted programs, plans and policies. The Ordinance would not conflict with the City’s Mobility Plan as no new permanent roadways or road modifications would be constructed as a result of the cessation of oil extraction. No impact would occur.

b) Conflict or be inconsistent with CEQA Guidelines Section 15064.3, subdivision (b)?

No Impact.

The State of California Governor’s Office of Planning and Research (OPR) issued proposed updates to the CEQA Guidelines in November 2017 and an accompanying technical advisory guidance finalized in December 2018 (OPR Technical Advisory) that amends the Appendix G threshold for significance for transportation impacts to delete reference to vehicle delay and level of service and instead refer to Section 15064.3, subdivision (b)(1) of the CEQA Guidelines asking if the project will result in a substantial increase in vehicle miles traveled (VMT). The California Natural Resources Agency certified and adopted the CEQA Guidelines (Public Resources Code 21000–21189) in December of 2018 and are now in effect. Accordingly, the City of Los Angeles has adopted significance criteria for transportation impacts based on VMT for land use projects and plans in accordance with the amended Appendix G threshold for significance. The City of Los Angeles has developed specific thresholds for land use projects and plans, neither of which are applicable to this ordinance.
The Ordinance would not generate new trips. For existing and idle wells, some minimal trips occur to conduct operation and maintenance activities. Once well operations cease, these trips would be reduced or completely eliminated. During the abandonment phase, trips would be generated as workers access the sites to complete the abandonment, however, once this phase is complete, these trips would cease as well. As the Ordinance would not generate net new trips, no impact would occur related to increases in VMT.

c) Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?

No Impact.

The Ordinance would not modify existing roadways or intersections, as such there would be no hazards due to design features or increased conflicts between incompatible uses that would occur as a result of the Ordinance. The Ordinance would not result in changes being made to the local roadways or impede public access on any public right-of-way. As such, the Project would not increase hazards due to a geometric design feature and no impact would occur.

d) Result in inadequate emergency access?

Less than Significant Impact.

The City has designated disaster routes through the Safety Element of the City General Plan. Implementation of the Ordinance would not hinder emergency access or evacuation routes. No changes to emergency routes would occur as part of the Project. While intermittent road closures could occur as a result of abandonment operations, it is not anticipated that such closures would result in substantial delays to service providers. Any lane closures must be approved by LADOT and they would not be approved if substantial delays could result. Typically, LADOT will require a construction traffic management plan, including use of flag personnel to help direct traffic around any roadway closures. Therefore, impacts related to emergency response and access as a result of the Ordinance would be less than significant, no mitigation is required.

XVIII. TRIBAL CULTURAL RESOURCES

Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:
a. Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k), or

☐ ☐ ☒ ☐

b. A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.

☐ ☐ ☒ ☐

a) Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is: Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1 (k)?

b) Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is: A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in
subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe?

**Less than Significant Impact.**

The Ordinance provides for the termination of all nonconforming oil uses over a 20-year amortization period. The Ordinance only affects the use of sites for existing oil and gas extraction activities. Most tribal cultural resources are anticipated with buried resources and land valued for association with tribal practices. The Ordinance will not result in excavation of soils or ground disturbance on undisturbed land. Therefore, impacts are anticipated to be less than significant.

Assembly Bill 52 (AB 52) established a formal consultation process for California Native American Tribes to identify potential significant impacts to Tribal Cultural Resources, as defined in Public Resources Code §21074, as part of CEQA. As specified in AB 52, lead agencies must provide notice inviting consultation to California Native American tribes that are traditionally and culturally affiliated with the geographic area of a proposed ordinance if the Tribe has submitted a request in writing to be notified of proposed ordinances. The Tribe must respond in writing within 30 days of the City’s AB 52 notice. In accordance with AB 52, on August 16, 2022, notice of the Ordinance has been provided to tribes who have requested such notice in the City of Los Angeles. As of the date of the publication of this document, the Gabrieleno Band of Mission Indians – Kizh Nation, and the Fernandeño Tataviam Band of Mission Indians have requested consultation. Consultation with the Gabrieleno Band of Mission Indians – Kizh Nation is ongoing, while consultation with the Fernandeño Tataviam Band of Mission Indians closed on September 2, 2022.

**XIX. UTILITIES AND SERVICE SYSTEMS**

<table>
<thead>
<tr>
<th>Potentially Significant Impact</th>
<th>Less Than Significant with Mitigation Incorporated</th>
<th>Less Than Significant Impact</th>
<th>No Impact</th>
</tr>
</thead>
</table>

Would the project:

a. Require or result in the relocation or construction of new or expanded water, wastewater treatment or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects? ☐ ☐ ☒ ☐
b. Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years? ☒

c. Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project’s projected demand in addition to the provider’s existing commitments? ☒

d. Generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals? ☒

e. Comply with federal, state, and local management and reduction statutes and regulations related to solid waste? ☒

a) Require or result in the relocation or construction of new or expanded water, wastewater treatment or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?

Less than Significant Impact.

Wastewater generated in the City is primarily treated at the Hyperion Treatment Plant in Playa del Rey. Wastewater reclamation plants that comprise the Hyperion Service Area have a total design capacity of 580 million gallons of wastewater per day (MGD). The RWQCB regulates the treatment of wastewater at treatment plants and the discharge of the treated wastewater into receiving waters. The Hyperion Treatment Plant is responsible for adhering to RWQCB regulations as they apply to wastewater generated in the City. LADWP is the primary provider of water and electric services for the City of Los Angeles, servicing more than four million customers.

Implementation of the Ordinance would not increase demand for water, wastewater, electrical power, natural gas, or telecommunication facilities. Nor would the Ordinance increase storm water runoff. The Ordinance does not affect natural gas managed by a
public utility. As stated in **Mineral Resources**, the City is moving away from petroleum and has implemented numerous goals and policies that support this shift. Further, as stated in **Greenhouse Gases**, the State is also mandating a shift from petroleum. Due to the small amount of oil that is extracted within the City (approximately two percent of the State total) and due to the incremental nature of the ordinance, no new or expanded facilities would be necessary. No impact would occur.

b) **Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years?**

*No Impact.*

The Ordinance would not create new demand for water supplies as no reasonably foreseeable future development would occur as a result of the Ordinance. No impact would occur.

c) **Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project’s projected demand in addition to the provider’s existing commitments?**

*No Impact.*

The Ordinance would not create new demand for wastewater treatment as no reasonably foreseeable future development would occur was a result of the Ordinance. No impact would occur.

d) **Generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?**

*No Impact.*

The Ordinance would not generate solid waste in excess of state or local standards as no reasonably foreseeable future development would occur was a result of the Ordinance. No impact would occur.

e) **Comply with federal, state, and local management and reduction statutes and regulations related to solid waste?**

*No Impact.*

All abandonment activities that would occur as a result of the Ordinance would be conducted in compliance with local and state regulations. While is it unlikely that any significant solid waste would be generated as a result of the Ordinance, all disposals would occur in accordance with local and state regulations. No impact would occur.
XX. WILDFIRE

If located in or near state responsibility areas or lands classified as very high fire hazard severity zones:

<table>
<thead>
<tr>
<th>Impact</th>
<th>Potentially Significant Impact</th>
<th>Less Than Significant with Mitigation Incorporated</th>
<th>Less Than Significant Impact</th>
<th>No Impact</th>
</tr>
</thead>
</table>

Would the project:

a. Substantially impair an adopted emergency response plan or emergency evacuation plan? ☐ ☐ ☒ ☐

b. Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire? ☐ ☐ ☐ ☒

c. Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment? ☐ ☐ ☐ ☒

d. Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes? ☐ ☐ ☐ ☒

a) Substantially impair an adopted emergency response plan or emergency evacuation plan?

*Less than Significant Impact.*

The City has designated disaster routes through the Safety Element of the City General Plan. Implementation of the Ordinance would not hinder emergency access or evacuation routes. No changes to emergency routes would occur as part of the project. While intermittent road closures could occur as a result of abandonment operations, it is not anticipated that such closures would result in substantial delays to service providers. Any lane closures must be approved by LADOT and they would not be approved if substantial
delays could result. Typically, LADOT will require a construction traffic management plan, including use of flag personnel to help direct traffic around any roadway closures. Therefore, impacts related to emergency response and access as a result of the Ordinance would be less than significant.

b) Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?

No Impact.

The Ordinance does not include the construction or maintenance of any structures that would pose a fire risk. There are currently 21 active wells and 2 idle wells located in the City's designated Very High Fire Hazard Severity Zone. As described throughout this document, any well abandonment activities would occur in accordance with local and state regulations to ensure proper protocols are followed. With compliance with existing regulations governing well abandonment, no impact would occur.

c) Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?

No Impact.

The Project is an ordinance and does not require the installation of any infrastructure that could exacerbate fire risks. As described throughout this document, any well abandonment activities would occur in accordance with local and State regulations to ensure proper protocols are followed. Well abandonment activities are anticipated to use existing infrastructure on site to complete the abandonment process with limited trucks access the wells to plug the wells. With compliance with existing regulations governing well abandonment, no impact would occur.

d) Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?

No Impact.

The Ordinance does not include any structures that would be susceptible to fire or those that would increase fire risk. As a result, there would be no risk of downslope or downstream flooding or landslides. As described throughout this document, any well abandonment activities would occur in accordance with local and state regulations to
ensure proper protocols are followed. With compliance with existing regulations governing well abandonment, no impact would occur.

XXI. MANDATORY FINDINGS OF SIGNIFICANCE

<table>

a. Does the project have the potential to substantially degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, substantially reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?

b. Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?

c. Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?

a) Does the project have the potential to substantially degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, substantially reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?

Less than Significant Impact.
For the reasons stated in this Initial Study, the Ordinance would not have the potential to
degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife
species, cause a fish or wildlife population to drop below self-sustaining levels, threaten
to eliminate a plant or animal community, reduce the number or restrict the range of a
rare or endangered plant or animal, or eliminate important examples of major periods of
California history or prehistory. Neither the implementation of the Ordinance nor the oil
well abandonment process will involve the disturbance of previously undisturbed land. As
discussed in this Initial Study, potential impacts related to biological, archaeological,
paleontological, and tribal cultural resources would be less than significant. No further
analysis is required.

b) Does the project have impacts that are individually limited, but cumulatively
considerable? (“Cumulatively considerable” means that the incremental effects
of a project are considerable when viewed in connection with the effects of past
projects, the effects of other current projects, and the effects of probable future
projects)?

Less than Significant Impact.

For the reasons stated in this Initial Study, implementation of the Ordinance would not
result in any potentially significant impacts and would not have the potential to contribute
to significant cumulative impacts. The impacts associated with individual well
abandonments have been found to be less than significant. Abandonment activities
associated with the citywide phase out of oil and gas drilling are anticipated to be
amortized across a 20-year period such that the combined impacts of well cessation and
abandonment across the City will not be cumulatively considerable. Impacts would be
less than significant and no further analysis is required.

c) Does the project have environmental effects which will cause substantial
adverse effects on human beings, either directly or indirectly?

Less than Significant Impact.

As identified throughout the analysis, the Ordinance would not have an environmental
effect that would cause substantial adverse effects on human beings directly or indirectly.
Impacts would be less than significant.

5 CONCLUSION

Based upon the information set forth above, and the substantial evidence contained in
the whole of the record of proceedings, the City has determined that with the
implementation of the feasible mitigation measures set forth in this Initial Study the
adoption of this Ordinance will not have a significant effect on the environment and a Mitigated Negative Declaration may be adopted.

Appendices
A   Sensitive Receptors
B   Air Quality & GHG Technical Data
1.0 INTRODUCTION

This Air Quality and Greenhouse Gas Technical Report describes the potential air quality and greenhouse gas (GHG) impacts of the proposed Oil and Gas Drilling Ordinance (Ordinance or Project) to prohibit new oil and gas extraction and make existing extraction activities a nonconforming use in all zones within the City of Los Angeles (City). This report has been prepared by Impact Sciences, Inc. to support the Project’s environmental documentation being prepared pursuant to the California Environmental Quality Act (CEQA). This analysis considers both the temporary air quality and GHG impacts that would result from the Ordinance and the long-term impacts associated with the implementation of the Ordinance.

1.1 PROJECT LOCATION

The Project is a citywide code amendment applicable within the boundaries of the City. The City has an approximate land area of 465 square miles (297,600 acres) with an estimated population of nearly 4.0 million residents in 2020 (3,898,747), according to the 2020 Census. The City lies within Los Angeles County which encompasses 4,000 square miles, 88 incorporated cities, and more than 10 million residents (10,014,009), according to the 2020 Census. The City is divided into 15 Council Districts and 35 Community Plan Areas. More than 87 percent of the City is developed with urban uses.

According to August 2022 data from the California Geologic Energy Management division (CalGEM), the City has 26 oil and gas fields that intersect city boundaries and 5,273 oil and gas wells. There are approximately 641 active, 1,350 idle, 35 canceled, and 3,247 plugged wells. 1 Of the City’s idle wells, as of July 2022, 56 are orphan wells likely to have no responsible solvent operator. There are oil and gas facilities in nearly every section of the City. 2 While some wells are situated in heavy industrial areas, others are located within residential neighborhoods and amongst community parks and schools. Much of the existing oil drilling and extraction is within underserved communities throughout the City.

Wells are found in nearly all parts of the City including but not limited to the communities of Wilmington, Harbor Gateway, Downtown, West Los Angeles, South Los Angeles, and the Northeast San Fernando Valley. While some wells are situated in heavy industrial areas, others are located in neighborhoods within

1 An active well is an oil well that has been drilled and completed, an idle well is inactive and not producing, but capable of being reactivated, a canceled well is one where a well permit was canceled prior to drilling, and a plugged well has been plugged and sealed to current standards.

2 There are two gas storage fields within the City, the Aliso Canyon and the Playa Del Rey Fields, which are both operated by the Southern California Gas Company (SoCalGas). SoCalGas is the primary operator of underground natural gas fields, natural gas storage wells, and natural gas transmission facilities within the City. No natural gas wells operated by public utilities would be impacted by the Ordinance.
close proximity to residences, schools, and other sensitive uses. For a list of sensitive receptors located in proximity to wells throughout the City, please refer to Appendix A to this report.

1.2 PROJECT DESCRIPTION

The Project is a proposed ordinance amending Sections 12.03, 12.20, 12.23, 12.24, and 13.01 of the Los Angeles Municipal Code (LAMC) to (1) eliminate the provisions of the LAMC that allow for the creation of new “O” Oil Drilling Supplemental Use Districts; (2) end by-right oil and gas extraction in the M3-Heavy Industrial Zones; (3) declare existing oil and gas extraction within the City a nonconforming use to terminate within 20 years; and (4) prohibit new or expanded oil and gas extraction activities (such as the drilling of new wells or the redrilling or deepening of existing wells). The Ordinance permits maintenance of the wells that the Zoning Administrator determines is necessary to protect public health and safety or the environment. Twenty years from the effective date of the Ordinance, all nonconforming oil and gas extraction uses will terminate.

This Ordinance is not applicable to (1) common carrier oil pipelines intended for regionally-coordinated transport of hydrocarbons; (2) service stations or like uses; (3) refineries; and (4) oil and injection wells that are verified to be plugged and abandoned in accordance with all applicable local, state, and federal laws, rules and regulations, including the California Statutes and Regulations overseen by the California Geologic Energy Management division (CalGEM), and LAFD and for which the well pad has been restored suitably for its subsequent use, and (5) any well operated by a public utility regulated by the California Public Utilities Commission, including those operating at the Aliso Canyon and Playa Del Rey Gas Storage Fields.

The Ordinance does not set a specific timetable for the closure and abandonment of wells, regulate the abandonment of oil wells that have permanently ceased operation, or mandate or regulate the remediation of well sites where extraction has terminated permanently.3

The Ordinance will make existing oil and gas drilling operations legally nonconforming uses in the City, subject to a 20-year amortization period. Existing oil and gas extraction activities may continue to operate until the end of the amortization period after which time all drilling-related activities must cease. After a well ceases operation, current regulations require that the well be abandoned and plugged. However, the current regulations do not establish a set time period by which the abandonment process must be

3 Public Resources Code Section 21000 requires that a lead agency identify all feasible mitigation measures that will avoid or substantially lessen the significant environmental effects of the project. This MND identifies areas of potentially significant impacts that would occur as a result of abandonment activities (See Noise, Geology and Soils). In accordance with CEQA, mitigation measures are proposed where such impacts could be reduced by their imposition.
1.0 Introduction

completed after a well ceases operation. As stated above, the Ordinance does not regulate abandonment when well operations permanently cease.

Currently it is unknown as to how many oil wells will permanently cease operations prior to the 20 year expiration date. This is because the time period that each of the City’s approximately 1,991 active and idle wells will permanently cease extraction and undergo abandonment depends on a number of individual factors. For example, upon the Ordinance becoming effective, some operators may choose to conclude operations immediately, while others may have contractual obligations to the landowners of the drilling sites and operate for a few years before the site is abandoned. Others may continue to operate until the end of the 20-year amortization period. However, once a well permanently ceases operation, there is a financial and economic incentive for the oil well operator to complete the abandonment process to reduce the costs of maintaining the well site. Therefore, because there is no reasonable way to accurately predict the timeline for cessation and abandonment at the individual level, this analysis instead assumes all oil drilling will cease 20 years from the effective date of the Ordinance as required. Abandonment of individual wells may occur at any time during the 20-year timeframe, and potentially beyond the 20-year timeframe.

Although not regulated by the Ordinance, well abandonment is a reasonably foreseeable outcome for many of the wells currently operating in the City, although as stated above, no specific timeline for abandonment currently exists and the Ordinance does not include any regulations related to the timing of the abandonment of oil wells. When a well is shut down, termination and abandonment activities will generally include (1) the cessation of production and drilling operations; (2) the closure and plugging of all oil and gas wells, including water flooding injection wells, except injection wells as permitted and demonstrated to be active and necessary by CalGEM; and (3) the plugging/capping of subsurface pipelines. Neither implementation of the Ordinance nor the oil well abandonment process should require excavation of previously undisturbed land and no new permanent structures would be constructed as part of the Project.

Termination activities of nonconforming oil and gas extraction must adhere to all applicable local, state, and federal laws, regulations, rules and standards, including the California Statutes and Regulations and all other requirements overseen by CalGEM as the principal regulatory authority for the closure of oil and gas extraction and production sites. Termination and abandonment activities will occur within previously disturbed and developed areas of the properties that encompass oil and gas extraction activities. In some cases, new access points may be necessary to allow for ingress/egress of equipment necessary to complete the abandonment of wells. However, no new permanent roads or permanent changes to existing roads would be necessary as part of the Project.
The closure of oil and gas wells entails plugging the wells in place in accordance with California Statutes and Regulations and all other applicable requirements as overseen by CalGEM. The process of well abandonment will be determined on a case-by-case basis under the regulatory supervision of CalGEM and the LAFD and will depend on individual site conditions such as type and depth of well. However, for the purposes of this environmental analysis, several generalized assumptions have been made based upon standard industry practice, existing regulations governing well abandonment, and case studies. While plugging and abandonment varies by well, there is a consistent set of procedures that are followed. Generally, the drill site’s existing drilling or maintenance rig will be used to abandon the well and remove equipment from the well. Well equipment will be removed from the site by truck. Cement trucks will also arrive onsite to fill the well at various depths over a span of several days. An operator may use in excess of 2,500 cubic feet of cement for one abandonment. The process entails removing equipment and filling the well with cement at different phases in order to ensure that it is safe to abandon the well at varying depths. At the end of each work day, the well site is closed and the rig is shut down in order to resume operations the following work day. CalGEM conducts inspections at certain milestones for this scope of work, including the following:

- Operators conduct a series of pressure tests on the wells to identify that there are no leaks or that the pressure is unsafe to work on the well. A test to measure any levels of hydrogen sulfide is common.
- Operators use a drilling or maintenance rig to work on the well and prepare blowout prevention equipment for the well that will be plugged.
- CalGEM inspects the blowout prevention equipment to ensure that it is safe for the operator to continue with plugging and abandonment work.
- Operators use the rig to pull out various cables, tubing, and other connections from the well casing.
- Operators may require the use of brine water to clean out different segments of the well. If no debris or sand is observed, then the operators continue using the rig to remove cables, tubing, and more connections from the well.
- After the operator has removed the sufficient amount of tubings, casing, and connections and there are minimal amounts of debris observed, then the operator will bring a cement truck to begin pouring fresh water and cement mix down the well. CalGEM is required to observe this first segment of pouring

---

4 When a drilling or maintenance rig is not on the well site, a rig will need to be brought to the site to complete the abandonment process.
as the inspector is looking to observe that the bottom hole is filled with the appropriate amount of cement.

- The operator continues to remove casings and tubings with support of the rig while also pouring cement down the well at depths deemed safe and clear enough to pour cement. Pressure testing of the well is frequently conducted to identify any safety risks.

- As the work nears the top segment of the well, the operator continues to use the rig and cement trucks are brought to the drill site to fill the well with cement. The ending segment can include up to 600 cubic feet of cement into the well’s casings in order to displace any well fluids or debris. The operator will fill the well casing to the near very top and this process is observed by CalGEM and by the Los Angeles Fire Department.

- At the conclusion, the operator removes any blowout prevention equipment from the rig and the well is closed and steel welded with the API Number and the LAFD Well Number identified on the top cover.

Given the varied timeline of individual well abandonment and the fact the Ordinance does not establish any regulations related to well site remediation or redevelopment (except where mitigation measures are required to reduce identified potentially significant impacts), it would be speculative to contemplate when site remediation would occur after the wells are abandoned and the types of redevelopment and future land uses that may occur on former drill sites. What might get built and at what intensity or scale is not possible to identify or analyze at this time. Therefore, the scope of analysis in this Initial Study is limited to (1) cessation of oil and gas extraction in the city and (2) abandonment activities that are reasonably foreseeable. The analysis does not examine impacts from remediation and/or future development. Those impacts would be analyzed in subsequent environmental analyses at either the programmatic or project level.
2.0  AIR QUALITY

2.1  AIR QUALITY SETTING

South Coast Air Basin

South Coast Air Basin Characteristics

The California Air Resources Board (CARB) divides the state into air basins that share similar meteorological and topographical features. The City of Los Angeles is located within the South Coast Air Basin (SCAB). The SCAB is the geographic region over which the South Coast Air Quality Management District (SCAQMD) has regulatory jurisdiction and encompasses 6,745 square miles covering all of Orange County and the non-desert portions of Los Angeles, Riverside, and San Bernardino Counties. The SCAB is a coastal plain with connecting broad valleys and low hills, bounded by the Pacific Ocean to the west; the San Gabriel, San Bernardino and San Jacinto Mountains to the north and east; and the San Diego County line to the south.

Temperature and Precipitation

The general region lies in the semi-permanent high-pressure zone of the eastern Pacific, resulting in a mild climate tempered by cool sea breezes with light average wind speeds. It is considered semi-arid and is characterized by warm summers, mild winters, infrequent seasonal rainfall, moderate daytime onshore breezes, and moderate humidity. This usually mild climatological pattern is interrupted occasionally by periods of extremely hot weather, winter storms, or Santa Ana winds. The annual average temperature varies little throughout the SCAB region, ranging from the low 60s to the high 80s, measures in degrees Fahrenheit (°F). With a more pronounced oceanic influence, coastal areas show less variability in annual minimum and maximum temperatures than inland areas.

In contrast to a very steady pattern of temperature, rainfall is seasonally and annually highly variable. Almost all annual rains fall between November and April. Summer rainfall is normally restricted to widely scattered thundershowers near the coast, with slightly heavier shower activity in the east and over the mountains.

Humidity

Although the SCAB has a semiarid climate, the air near the earth’s surface is typically moist because of the presence of a shallow marine layer. Except for infrequent periods when dry, continental air is brought into the SCAB by offshore winds, the “ocean effect” is dominant. Periods of heavy fog, especially along the
2.0 Air Quality

cost, are frequent, and low clouds, often referred to as high fog, are a characteristic climate feature. Annual average humidity is 70 percent at the coast and 57 percent in the eastern portions of the SCAB.

Wind

Wind patterns across the south coastal region are characterized by westerly or southwesterly onshore winds during the day and by easterly or northeasterly breezes at night. Wind speed is higher during the dry summer months than during the rainy winter.

Between periods of wind, air stagnation may occur in both the morning and evening hours. Air stagnation is one of the critical determinants of air quality conditions on any given day. During the winter and fall, surface high-pressure systems over the SCAB, combined with other meteorological conditions, can result in very strong, downslope Santa Ana winds. These winds normally continue a few days before predominant meteorological conditions are reestablished.

The mountain ranges to the east affect the diffusion of pollutants by inhibiting the eastward transport of pollutants. Air quality in the SCAB generally ranges from fair to poor and is similar to air quality in most of coastal Southern California. The entire region experiences heavy concentration of air pollutants during prolonged periods of stable atmospheric conditions.

Inversions

In conjunction with the two characteristic wind patterns that affect the rate and orientation of horizontal pollutant transport, two similarly distinct types of temperature inversions control the vertical depth through which pollutants are mixed. These inversions are the marine/subsidence inversion and the radiation inversion. The height of the base of the inversion at any given time is known as the “mixing height.”

The SCAB experiences a persistent temperature inversion (increasing temperature with increasing altitude) as a result of the Pacific high air masses in the lower atmosphere that effectively trap pollutants near the Earth’s surface by limiting vertical mixing, especially in the summer. Atmospheric temperature typically decreases with altitude. However, under inversion conditions, temperature increases as altitude increases, thereby preventing air close to the ground from mixing with the air above it. The combination of winds and inversions is a critical determinant leading to highly degraded air quality in the summer and generally good air quality in the winter in Los Angeles.
Air Pollutants of Concern

Criteria air pollutants are defined as pollutants for which the federal and state governments have established ambient air quality standards for outdoor concentrations. The federal and state standards have been set at levels above which concentrations could be harmful to human health and welfare. These standards are designed to protect the most sensitive persons such as children, pregnant women, and the elderly, from illness or discomfort. Criteria air pollutants include ozone (O₃), nitrogen dioxide (NO₂), carbon monoxide (CO), sulfur dioxide (SO₂), particulate matter 2.5 microns or less in diameter (PM2.5), particulate matter ten microns or less in diameter (PM10), and lead (Pb). Note that reactive organic gases (ROGs), which are also known as reactive organic compounds (ROCs) or volatile organic compounds (VOCs), and nitrogen oxide (NOx) are not classified as criteria pollutants. However, ROGs and NOx are widely emitted from land development projects and participate in photochemical reactions in the atmosphere to form O₃; therefore, NOx and ROGs are relevant to the proposed project and are of concern in the air basin and are listed below along with the criteria pollutants. Sources and health effects commonly associated with criteria pollutants are summarized in Table 1, Criteria Pollutants Summary of Common Sources and Effects.
2.0 Air Quality

<table>
<thead>
<tr>
<th>Pollutant</th>
<th>Major Man-Made Sources</th>
<th>Human Health &amp; Welfare Effects</th>
</tr>
</thead>
<tbody>
<tr>
<td>Carbon Monoxide (CO)</td>
<td>An odorless, colorless gas formed when carbon in fuels is not burned completely; a component of motor vehicle exhaust.</td>
<td>Reduces the ability of blood to deliver oxygen to vital tissues, affecting the cardiovascular and nervous system. Impairs vision, causes dizziness, and can lead to unconsciousness or death.</td>
</tr>
<tr>
<td>Nitrogen Dioxide (NO2)</td>
<td>A reddish-brown gas formed during fuel combustion for motor vehicles and industrial sources. Sources include motor vehicles, electric utilities, and other sources that burn fuel.</td>
<td>Respiratory irritant; aggravates lung and heart problems. Precursor to ozone and acid rain. Contributes to global warming and nutrient overloading which deteriorates water quality. Causes brown discoloration of the atmosphere.</td>
</tr>
<tr>
<td>Ozone (O3)</td>
<td>Formed by a chemical reaction between volatile organic compounds (VOC) and nitrous oxides (NOx) in the presence of sunlight. VOCs are also commonly referred to as reactive organic gases (ROGs). Common sources of these precursor pollutants include motor vehicle exhaust, industrial emissions, gasoline storage and transport, solvents, paints, and landfills.</td>
<td>Irritates and causes inflammation of the mucous membranes and lung airways; causes wheezing, coughing, and pain when inhaling deeply; decreases lung capacity; aggravates lung and heart problems. Damages plants; reduces crop yield. Damages rubber, some textiles, and dyes.</td>
</tr>
<tr>
<td>Particulate Matter (PM10 &amp; PM2.5)</td>
<td>Produced by power plants, steel mills, chemical plants, unpaved roads and parking lots, wood-burning stoves and fireplaces, automobiles, and others.</td>
<td>Increased respiratory symptoms, such as irritation of the airways, coughing or difficulty breathing; aggravated asthma; development of chronic bronchitis; irregular heartbeat; nonfatal heart attacks; and premature death in people with heart or lung disease. Impairs visibility (haze).</td>
</tr>
<tr>
<td>Sulfur Dioxide (SO2)</td>
<td>A colorless, nonflammable gas formed when fuel containing sulfur is burned; when gasoline is extracted from ore. Examples are petroleum refineries, cement manufacturing, metal processing facilities, locomotives, and ships.</td>
<td>Respiratory irritant; aggravates lung and heart problems. In the presence of moisture and oxygen, sulfur dioxide converts to sulfurous acid which can damage marble, iron, and steel. Damages crops and natural vegetation. Impairs visibility. Precursor to acid rain.</td>
</tr>
</tbody>
</table>

2.2 AMBIENT AIR QUALITY

Air pollutant emissions in the SCAB are generated by stationary and mobile sources. Stationary sources can be divided into two major subcategories: point sources and area sources. Point sources occur at an identified location and are usually associated with manufacturing and industry. Examples of point sources are boilers or combustion equipment that produce electricity or generate heat. Area sources are widely distributed and produce many small emissions. Examples of area sources include residential and commercial water heaters, painting operations, lawn mowers, agricultural fields, landfills, and consumer products, such as barbeque lighter fluid and hair spray. Mobile sources are emissions from motor vehicles, including tailpipe and evaporative emissions, and are classified as either on-road or off-road. On-road sources may be legally operated on roadways and highways. Off-road sources include aircraft, ships, trains,
race cars, and self-propelled construction equipment. Air pollutants can also be generated by the natural environment, such as when fine dust particles are pulled off the ground surface and suspended in the air during high winds.

Ambient air quality is determined primarily by the type and amount of pollutants emitted into the atmosphere, as well as the size, topography, and meteorological conditions of a geographic area. The SCAB has low mixing heights and light winds, which help to accumulate air pollutants. Exhaust emissions from mobile sources generate the majority of ROG, CO, NOx, and SOx both in the SCAB generally and specifically the Los Angeles County portion of the SCAB. Area-wide sources generate the most airborne particulates (i.e., PM10 and PM2.5) in both the SCAB and Los Angeles County. The determination of whether a region’s air quality is healthful or unhealthful is made by comparing contaminant levels in ambient air samples to national and state standards. Measurements of ambient concentrations of criteria pollutants are used by the U.S. EPA and the CARB to assess and classify the air quality of each air basin, county, or, in some cases, a specific urbanized area.

The federal Clean Air Act (CAA) requires U.S. EPA to designate areas as attainment, nonattainment, or maintenance (previously nonattainment and currently attainment) for each criteria pollutant (O₃, NOx, CO, SO₂, PM10, PM2.5, and Pb) based on whether the National Ambient Air Quality Standards (NAAQS) have been achieved. The NAAQS are summarized in Table 2. The classification is determined by comparing actual monitoring data with national standards. If a pollutant concentration measured over time in a particular area consistently remains below the standard level, the area is classified as being in “attainment” of the air quality standard. If the pollutant concentration exceeds the standard, the area is classified as a “nonattainment” area. If the agencies are unable to gather sufficient data to determine whether the standard is met in an area, the area is typically designated as “unclassified.” The U.S. EPA has classified the Los Angeles County portion of the SCAB as a nonattainment area for O₃, PM2.5, and Pb, as presented in Table 2, below.

The California Clean Air Act (CCAA) requires the CARB to designate areas within California as either attainment or nonattainment for each criteria pollutant based on whether the California Ambient Air Quality Standards (CAAQS) have been achieved. As shown in Table 2, the CAAQS are generally more stringent than the NAAQS; and additional state standards are specified for sulfates, hydrogen sulfide (H₂S), vinyl chloride, and visibility-reducing particles. Under the CCAA, areas are designated as nonattainment for a pollutant if air quality data shows that a state standard for the pollutant was violated at least once during the previous three calendar years. Exceedances that are affected by highly irregular or infrequent events are not considered violations of a state standard and are not used as a basis for designating areas as nonattainment. Under the CCAA, the non-desert Los Angeles County portion of the Basin is designated as a nonattainment area for O₃, PM2.5, and PM10 as shown in Table 3.

### Local Air Quality

Ambient air quality in Los Angeles can be inferred from ambient air quality measurements conducted at nearby air quality monitoring stations. The SCAQMD jurisdiction is divided geographically into 38 source receptor areas (SRAs), wherein 37 monitoring stations operate—one station in each SRA excluding SRA 7—to measure and record concentrations of the regulated pollutants that provide representative air quality conditions in the region. The 38 SRAs are divided based on proximity to air monitoring stations and local meteorological patterns. The purpose of the monitoring station is to measure ambient concentrations of pollutants and determine whether ambient air quality meets the National Ambient Air Quality Standards (NAAQS) and the California Ambient Air Quality Standards (CAAQS). Ozone and particulate matter (PM10 and PM2.5) are pollutants of particular concern in the SCAB.

The City of Los Angeles encompasses parts of eight SRAs in the Coastal, Metropolitan, San Fernando Valley, and San Gabriel Valley areas (See Figure 1, South Coast Source Receptor Areas in the City of Los Angeles). (SRA 1, described as Central Los Angeles County; SRA 2, described as Northwest Los Angeles County Coastal; SRA 3, described as Southwest Los Angeles County Coastal; SRA 4, described as South Los Angeles County Coastal; SRA 6, described as West San Fernando Valley; SRA 7, described as East San
Fernando Valley; SRA 8, described as West San Gabriel Valley; and SRA 12, described as South Central Los Angeles County).

Air quality conditions in the City are characterized by concentrations of air pollutants measured at the monitoring stations located within the City. Each station records concentrations of O₃, CO, NO₂, SO₂, PM10, and PM2.5 at timescales that match the corresponding ambient air quality standards. Table 4 presents the monitored air quality data from each SRA Monitoring Station from 2018 to 2020.

<sup>1</sup> Parts by volume per million of air (ppm), micrograms per cubic meter of air (µg/m<sup>3</sup>), or annual arithmetic mean (aam).

<sup>2</sup> The 8-hour federal O<sub>3</sub> standard was revised from 0.075 ppm to 0.070 ppm in 2015. The statistics shown are based on the 2015 standard of 0.070 ppm.

<sup>3</sup> Data collected from SCAQMD Station Number 77.
According to air quality data from SCAQMD Monitoring Stations shown in Table 4, concentrations of O₃ exceeded the State 1-hour standard at least once in each of the three years presented in six of the SRAs. Levels of O₃ also exceeded the national and State 8-hour standards at least once in six of the SRAs between 2018–2020. PM10 concentrations did not exceed the 24-hour NAAQS during the three-year period; however, concentrations did exceed the applicable State 24-hour PM10 standard in three of the SRAs between 2018–2020 but did not exceed the Federal 24-hour PM10 standard. PM2.5 concentrations exceeded the federal 24-hour standard at least once between 2018-2020 in three of the SRAs. The data demonstrate consistency with the nonattainment designations in Table 3, above.

Toxic Air Contaminants

In addition to the criteria pollutants discussed above, toxic air contaminants (TACs) are another group of pollutants of concern. TACs are considered either carcinogenic or noncarcinogenic based on the nature of the health effects associated with exposure to the pollutant. For regulatory purposes, carcinogenic TACs are assumed to have no safe threshold below which health impacts would not occur, and cancer risk is expressed as excess cancer cases per one million exposed individuals. Noncarcinogenic TACs differ in that there is generally assumed to be a safe level of exposure below which no negative health impact is believed to occur. These levels are determined on a pollutant-by-pollutant basis.

There are many different types of TACs, with varying degrees of toxicity. Sources of TACs include industrial processes, such as petroleum refining and chrome-plating operations; commercial operations, such as gasoline stations and dry cleaners; and motor vehicle exhaust. Public exposure to TACs can result from emissions from normal operations, as well as from accidental releases of hazardous materials during upset conditions. The health effects associated with TACs are quite diverse and generally are assessed locally, rather than regionally. TACs can cause long-term health effects such as cancer, birth defects, neurological damage, asthma, bronchitis, or genetic damage, or short-term acute affects such as eye watering, respiratory irritation (a cough), running nose, throat pain, and headaches.

To date, CARB has designated 244 compounds as TACs. Additionally, CARB has implemented control measures for a number of compounds that pose high risks and show potential for effective control. The majority of the estimated health risks from TACs can be attributed to a relatively few compounds.⁵

CARB identified diesel particulate matter (DPM) as a TAC. DPM differs from other TACs in that it is not a single substance but rather a complex mixture of hundreds of substances. Diesel exhaust is a complex mixture of particulates and gases produced when an engine burns diesel fuel. DPM is a concern because it

---

causes lung cancer; many compounds found in diesel exhaust are carcinogenic. DPM includes the particle-
phase constituents in diesel exhaust. The chemical composition and particle sizes of DPM vary between
different engine types (heavy-duty, light-duty), engine operating conditions (idle, accelerate, decelerate),
fuel formulations (high/low sulfur fuel), and the year of the engine. Some short-term (acute) effects of diesel
exhaust include eye, nose, throat, and lung irritation, and diesel exhaust can cause coughs, headaches, light-
headedness, and nausea. DPM poses the greatest health risk among the TACs. Almost all diesel exhaust
particle mass is 10 microns or less in diameter. Because of their extremely small size, these particles can be
inhaled and eventually trapped in the bronchial and alveolar regions of the lung.

Sensitive Receptors

Some land uses are considered more sensitive to air pollution than others due to the types of population
groups or activities involved. Sensitive population groups include children, the elderly, the acutely ill, and
the chronically ill, especially those with cardiovascular diseases.6

Residential areas are considered sensitive receptors to air pollution because residents (including children
and the elderly) tend to be at home for extended periods of time, resulting in sustained exposure to any
pollutants present. Children are considered more susceptible to health effects of air pollution due to their
immature immune systems and developing organs.7 As such, schools are also considered sensitive
receptors, as children are present for extended durations and engage in regular outdoor activities.
Recreational land uses are considered moderately sensitive to air pollution. Although exposure periods are
generally short, exercise places a high demand on respiratory functions, which can be impaired by air
pollution. In addition, noticeable air pollution can detract from the enjoyment of recreation.

In addition to the numerous parcels zoned for residential uses in proximity to oil wells throughout the City,
there are approximately 766 air quality sensitive uses within 100 feet of oil wells.8 These sensitive land uses
consist of schools, day cares, elder care facilities, adult residential facilities, parks, and hospitals. Please
refer to Appendix A to this report for more information related to sensitive receptors located in proximity
to oil wells.

7 Office of Environmental Health Hazard Assessment and The American Lung Association of California. Air
Pollution and Children’s Health. Available online at: https://oehha.ca.gov/media/downloads/faqs/kidsair4-02.pdf,
8 Due to the programmatic nature of this analysis, it is acknowledged that not every sensitive receptor will be
identified. However, a good-faith effort at identifying the known sensitive receptors has been included in
Appendix A to this report.
Existing Health Risk

The Multiple Air Toxics Exposure Study V (MATES V) is a monitoring and evaluation study conducted by the SCAQMD in SCAB. Originally developed in 1986 and now in its fifth iteration, the MATES V program relied on concentrations of more than 30 TACs—including both gases and particulates—measured at 10 fixed sites throughout the SCAB during the 2018–2019 period in conjunction with a basin-wide TAC emissions inventory and a regional modeling effort to characterize ambient excess carcinogenic risks across the SCAB.9 MATES V also included an exploratory analysis of chronic non-cancer health impacts (e.g., cardiovascular, respiratory, neurological health outcomes, etc.) based on the measured concentrations and modeled emissions. The results of MATES V determined that the carcinogenic risk estimated from data collected at the 10 monitoring sites was approximately 40 percent lower on average than the risk that was estimated in MATES IV using monitoring data from the 2012–2013 time period. The estimated SCAB-wide population-weighted cancer risk calculated from the modeling data estimated that the reduction relative to MATES IV was approximately 54 percent, similar to the decrease demonstrated in monitored data. Based on the inhalation exposure pathway only, MATES-V found that the average population-weighted carcinogenic risk in the SCAB declined from 897 per million in 2012–2013 to 424 in a million in 2018–2019.

At the county level, Los Angeles County ambient average inhalation-pathway population-weighted cancer risk decreased from approximately 1,015 per million in MATES IV to 462 per million in MATES V, a reduction of 54 percent, which is similar to the modeled reduction across the SCAB. Accounting for multiple exposure pathways, the highest carcinogenic risk in MATES V was estimated near the Ports of Los Angeles and Long Beach to be approximately 960 per million, and the countywide average for Los Angeles County was approximately 497 per million (approximately 57 percent lower than MATES IV results). The MATES V ambient carcinogenic risk in the City of LA ranges between approximately 670 and 800 per million. According to the MATES V data visualizer, approximately 70 percent of the ambient excess cancer risk is attributed to diesel PM concentrations.

2.3 EXISTING OIL & GAS AIR QUALITY EMISSIONS

Oil and gas operations throughout the City contribute to existing local and regional air quality conditions. Existing operating emissions fall into two general categories: 1) worker commutes and 2) fugitive emissions. Typical emissions from worker commutes (i.e., motor vehicle trips) include ROG, NOx, CO,

3.0 Greenhouse Gas

SOx, PM10 and PM2.5. These emissions were estimated with the use of the California Emissions Estimator Model (CalEEMod). See Appendix B to this report.

Fugitive emissions include ROGs (also referred to as volatile organic compounds) which may include but not be limited to pentane, n-pentane, hexane, ethane, and other longer-chain hydrocarbons. In general, fugitive emissions from oil and gas activities may be attributed to the following primary types of sources: fugitive equipment leaks; process venting; evaporation losses; disposal of waste gas streams (e.g., by venting or flaring), and accidents and equipment failures. Fugitive leaks from piping and equipment are typically small yet detectable emissions from equipment where there are joints, flanges, and seals. Although joints and flanges are typically bolted, small amounts of hydrocarbons may be emitted through leaky joints.

It should be noted that fugitive emissions are difficult to quantify with a high degree of accuracy and there remains substantial uncertainty in the emission factors and calculation methodologies for oil and gas activities. This is due to the numerous types of sources and many variables to be considered. The key emission assessment issues are: (a) use of simple production-based emission factors is susceptible to excessive errors; (b) use of rigorous bottom-up approaches requires expert knowledge to apply and relies on detailed data which may be difficult and costly to obtain; and (c) measurement programs are time consuming and very costly to perform. Nevertheless, Table 5, Existing Oil & Gas Air Quality Emissions, has been included as a good-faith effort to illustrate the potential scope of air quality emissions associated with existing oil and gas operations throughout the City. See Appendix B to this report for further information related to calculations and assumptions utilized to prepare these estimates.

10 Intergovernmental Panel on Climate Change, Good Practice Guidance and Uncertainty Management in National Greenhouse Gas Inventories, Fugitive Emissions From Oil and Natural Gas Activities.
2.4 REGULATORY FRAMEWORK

Federal

Clean Air Act

Federal Clean Air Act. The Federal Clean Air Act (CAA) was enacted in 1970 and has been amended numerous times in subsequent years, with the most recent amendments occurring in 1990.11 The CAA is the comprehensive federal law that regulates air emissions in order to protect public health and welfare.12 The U.S. EPA is responsible for the implementation and enforcement of the CAA, which establishes federal National Ambient Air Quality Standards (NAAQS), specifies future dates for achieving compliance, and requires the U.S. EPA to designate areas as attainment, nonattainment, or maintenance. The CAA also mandates that each state submit and implement a State Implementation Plan (SIP) for each criteria pollutant for which the state has not achieved the applicable NAAQS. The SIP includes pollution control measures that demonstrate how the standards for those pollutants will be met. The sections of the CAA most applicable to land use development projects include Title I (Nonattainment Provisions) and Title II (Mobile Source Provisions).13

Title I requirements are implemented for the purpose of attaining NAAQS for criteria air pollutants. Table 2, Ambient Air Quality Standards, shows the NAAQS currently in effect for each criteria pollutant. The Air Basin fails to meet national standards for O3 and PM2.5 and, therefore, is considered a federal “non-attainment” area for these pollutants, as shown in Table 3. Therefore, the Air Basin is subject to the requirements of demonstrating a path towards attaining the NAAQS as part of the SIP. The NAAQS and the CAAQS, which are generally more stringent, have been set at levels considered safe to protect public health, including the health of sensitive populations and to protect public welfare.

Title II pertains to mobile sources, which includes on-road vehicles (e.g., cars, buses, motorcycles) and non-road vehicles (e.g., aircraft, trains, construction equipment). Reformulated gasoline and automobile pollution control devices are examples of the mechanisms the U.S. EPA uses to regulate mobile air emission sources. The provisions of Title II have resulted in tailpipe emission standards for vehicles, which have been strengthened in recent years to improve air quality. For example, the standards for NOx emissions

---

13 United States Environmental Protection Agency, Clean Air Act Overview, Clean Air Act Table of Contents by Title, Last Updated January 3, 2017, https://www.epa.gov/clean-air-act-overview/clean-air-act-text, accessed August 16, 2022. As shown therein, Title I addresses nonattainment areas and Title II addresses mobile sources.
have been lowered substantially and the specification requirements for cleaner burning gasoline are more stringent.

**National Emissions Standards for Hazardous Air Pollutants Program**

Under federal law, 187 substances are currently listed as hazardous air pollutants (HAPs). Major sources of specific HAPs are subject to the requirements of the National Emissions Standards for Hazardous Air Pollutants (NESHAPS) program. The EPA is establishing regulatory schemes for specific source categories and requires implementation of the Maximum Achievable Control Technologies (MACT) for major sources of HAPs in each source category. State law has established the framework for California’s TAC identification and control program, which is generally more stringent than the federal program and is aimed at HAPs that are a problem is California. The state has formally identified 244 substances as TACs and is adopting appropriate control measures for each. Once adopted at the state level, each air district will be required to adopt a measure that is equally or more stringent.

**National Ambient Air Quality Standards**

The federal CAA required the U.S. EPA to establish NAAQS. The NAAQS set primary standards and secondary standards for specific air pollutants. Primary standards define limits for the intention of protecting public health, which include sensitive populations such as asthmatics, children, and the elderly. Secondary Standards define limits to protect public welfare to include protection against decreased visibility, damage to animals, crops, vegetation, and buildings. A summary of the federal ambient air quality standards is shown in Table 2, Ambient Air Quality Standards.

**State**

**California Clean Air Act of 1988**

The California CAA of 1988 (CCAA) allows states to adopt ambient air quality standards and other regulations provided that they are at least as stringent as federal standards. The California Air Resources Board (CARB), a part of the California Environmental Protection Agency (Cal EPA), is responsible for the coordination and administration of both federal and state air pollution control programs within California, including setting the CAAQS. The CCAA, amended in 1992, requires all air quality management districts (AQMDs) in the state to achieve and maintain the CAAQS. The CAAQS are generally stricter than national standards for the same pollutants and has also established state standards for sulfates, hydrogen sulfide, vinyl chloride, and visibility-reducing particles, for which there are no national standards. CARB also conducts research, compiles emission inventories, develops suggested control measures, and provides oversight of local programs. CARB also has primary responsibility for the development of California’s State
3.0 Greenhouse Gas

Implementation Plan (SIP), for which it works closely with the federal government and the local air districts.

California Ambient Air Quality Standards

The federal CAA permits states to adopt additional or more protective air quality standards if needed. California has set standards for certain pollutants, such as particulate matter and ozone, which are more protective of public health than respective federal standards. California has also set standards for some pollutants that are not addressed by federal standards. The state standards for ambient air quality are summarized in Table 2, Ambient Air Quality Standards.

California State Implementation Plan

The federal CAA (and its subsequent amendments) requires each state to prepare an air quality control plan referred to as a State Implementation Plan (SIP). The SIP is a living document that is periodically modified to reflect the latest emissions inventories, plans, and rules and regulations of air basins as reported by the agencies with jurisdiction over them. The CAA Amendments dictate that states containing areas violating the NAAQS revise their SIPs to include extra control measures to reduce air pollution. The SIP includes strategies and control measures to attain the NAAQS by deadlines established by the CAA. The EPA has the responsibility to review all SIPs to determine if they conform to the requirements of the CAA.

State law makes CARB the lead agency for all purposes related to the SIP. Local air districts and other agencies prepare SIP elements and submit them to CARB for review and approval. CARB then forwards SIP revisions to the EPA for approval and publication in the Federal Register. The 2016 Air Quality Management Plan (2016 AQMP) is the SIP for SCAB. The 2016 AQMP is a regional blueprint for achieving air quality standards and healthful air in the SCAB and those portions of the Salton Sea Air Basin (SSAB) that are under the SCAQMD’s jurisdictions. The 2016 AQMP represents a new approach, focusing on available, proven, and cost effective alternatives to traditional strategies, while seeking to achieve multiple goals in partnerships with other entities promoting reductions in greenhouse gases and toxic risk, as well as efficiencies in energy use, transportation, and goods movement. The most effective way to reduce air pollution impacts is to reduce emissions from mobile sources. The AQMP relies on regional and multi-level partnerships of governmental agencies at the federal, state, regional, and local level. Those agencies (EPA, CARB, local governments, Southern California Association of Governments [SCAG] and the SCAQMD) are the primary agencies that implement the AQMP programs. The 2016 AQMP incorporates the latest scientific and technical information and planning assumptions, including SCAG’s 2016-2035 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS), updated emission inventory.
methodologies for various source categories, and SCAG’s latest growth forecasts. The 2016 AQMP includes integrated strategies and measures to meet the NAAQS.

On September 3, 2020, SCAG’s Regional Council unanimously voted to approve and fully adopt Connect SoCal (2020-2045 RTP/SCS). However, the forecasts and measures in the plan have not been incorporated into any applicable air quality plan for the region.14

California Code of Regulations. The California Code of Regulations (CCR) is the official compilation and publication of regulations adopted, amended or repealed by state agencies pursuant to the Administrative Procedure Act. The CCR includes regulations that pertain to air quality emissions. Section 2485 in Title 13 of the CCR states that the idling of all diesel-fueled commercial vehicles (weighing over 10,000 pounds) during construction shall be limited to five minutes at any location. Section 93115 in Title 17 of the CCR states that operations of any stationary, diesel-fueled, compression-ignition engines shall meet specified fuel and fuel additive requirements and emissions standards. In addition, Section 95668 in Title 17 establishes greenhouse gas emission standards for crude oil and natural gas facilities.

California Air Toxics “Hot Spots” Information and Assessment Act (AB 2588)

The California Air Toxics Program is supplemented by the Air Toxics “Hot Spots” program, which became law (AB 2588, Statutes of 1987) in 1987. In 1992, the AB 2588 program was amended by Senate Bill 1731 to require facilities that pose a significant health risk to the community to perform a risk reduction audit and reduce their emissions through implementation of a risk management plan. Under this program, which is required under the Air Toxics “Hot Spots” Information and Assessment Act (Section 44363 of the California Health and Safety Code), facilities are required to report their air toxics emissions, assess health risks, and notify nearby residents and workers of significant risks when present.

Typically, land development projects generate diesel emissions from construction vehicles during the construction phase, as well as some diesel emissions from small trucks during the operational phase. Diesel exhaust is mainly composed of particulate matter and gases, which contain potential cancer-causing substances. Emissions from diesel engines currently include over 40 substances that are listed by EPA as hazardous air pollutants and by CARB as TACs. On August 27, 1998, CARB identified particulate matter

in diesel exhaust as a TAC, based on data linking diesel particulate emissions to increased risks of lung cancer and respiratory disease.\textsuperscript{15}

In March 2015, the OEHHA adopted “The Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments” in accordance with the Health and Safety Code, Section 44300. The Final Guidance Manual incorporates the scientific basis from three earlier developed Technical Support Documents to assess risk from exposure to facility emissions. The 2015 OEHHA Final Guidance has key changes including greater age sensitivity in particular for children, decreased exposure durations, and higher breathing rate profiles. Because cancer risk could be up to three times greater using this new guidance, it may result in greater mitigation requirements, more agency backlog, and increased difficulty in getting air permits. Regardless of the change in calculation methodology, actual emissions and cancer risk within South Coast Air Basin has declined by more than 50 percent since 2005.

The CARB provides a computer program, the Hot Spots Analysis and Reporting Program (HARP), to assist in a coherent and consistent preparation of an HRA. HARP2, an update to HARP, was released in March 2015. HARP2 has a more refined risk characterization in HRA and CEQA documents and incorporates the 2015 OEHHA Final Guidance.

**Diesel Risk Reduction Program.** CARB identified particulate emissions from diesel-fueled engines as TACs in August 1998. Following the identification process, the ARB was required by law to determine if there is a need for further control, which moved us into the risk management phase of the program. CARB developed the *Risk Reduction Plan to Reduce Particulate Matter Emissions from Diesel-Fueled Engines and the Vehicles and the Risk Management Guidance for the Permitting of New Stationary Diesel-Fueled Engines*. The Diesel Advisory Committee approved these documents on September 28, 2000, paving the way for the next step in the regulatory process: the control measure phase. During the control measure phase, specific statewide regulations designed to further reduce DPM emissions from diesel-fueled engines and vehicles have and continue to be evaluated and developed. The goal of each regulation is to make diesel engines as clean as possible by establishing state-of-the-art technology requirements or emission standards to reduce DPM emissions.

Regional

South Coast Air Quality Management District (SCAQMD). The SCAQMD is primarily responsible for planning, implementing, and enforcing air quality standards for the South Coast Air Basin. The Air Basin is a subregion within the western portion of the SCAQMD jurisdiction, as the SCAQMD also regulates portions of the Salton Sea Air Basin and Mojave Desert Air Basin within Riverside County.

Air Quality Management Plan and RTP/SCS. To meet the NAAQS and CAAQS, the SCAQMD has adopted a series of AQMPs, which serve as a regional blueprint to develop and implement an emission reduction strategy that will bring the area into attainment with the standards in a timely manner. The 2016 AQMP includes strategies to ensure that rapidly approaching attainment deadlines for O₃ and PM2.5 are met, and that public health is protected to the maximum extent feasible. The most significant air quality challenge in the Air Basin is to reduce NOₓ emissions sufficiently to meet the upcoming O₃ standard deadlines, as NOₓ plays a critical role in the creation of O₃. The AQMP’s strategy to meet the 8-hour O₃ standard in 2023 should lead to sufficient NOₓ emission reductions to attain the 1-hour O₃ standard by 2022. Since NOₓ emissions also lead to the formation of PM2.5, the NOₓ reductions needed to meet the O₃ standards will likewise lead to improvement of PM2.5 levels and attainment of PM2.5 standards.17 18

The AQMP also incorporates the transportation strategy and transportation control measures from SCAG’s adopted 2016-2040 RTP/SCS (2016-2040 RTP/SCS)19 Plan. SCAG is the regional planning agency for Los Angeles, Orange, Ventura, Riverside, San Bernardino, and Imperial Counties, and addresses regional issues relating to transportation, the economy, community development and the environment. SCAG coordinates with various air quality and transportation stakeholders in Southern California to ensure compliance with the federal and state air quality requirements. Pursuant to California Health and Safety Code Section 40460, SCAG has the responsibility of preparing and approving the portions of the AQMP relating to the regional demographic projections and integrated regional land use, housing, employment, and transportation programs, measures, and strategies. SCAG is required by law to ensure that transportation activities “conform” to, and are supportive of, the goals of regional and state air quality plans to attain the NAAQS. The RTP/SCS includes transportation programs, measures, and strategies generally designed to reduce vehicle miles traveled (VMT), which are contained in the AQMP. The SCAQMD combines its portion of

---

16 NOₓ emissions are a precursor to the formation of both O₃ and secondary PM2.5.
17 Estimates are based on the inventory and modeling results and are relative to the baseline emission levels for each attainment year (see Final 2016 AQMP for detailed discussion).
the AQMP with those prepared by SCAG. The RTP/SCS and Transportation Control Measures, included as Appendix IV-C of the 2016 AQMP for the Air Basin, are based on SCAG’s 2016-2040 RTP/SCS.

The 2016 AQMP forecasts the 2031 emissions inventories “with growth” based on SCAG’s 2016-2040 RTP/SCS. The region is projected to see a 12 percent growth in population, 16 percent growth in housing units, 23 percent growth in employment, and 8 percent growth in vehicle miles traveled between 2012 and 2031. Despite regional growth in the past, air quality has improved substantially over the years, primarily due to the effects of air quality control programs at the local, state and federal levels.

On September 3, 2020, SCAG’s Regional Council adopted the 2020-2045 RTP/SCS. The 2020-2045 RTP/SCS was determined to conform to the federally-mandated state implementation plan (SIP), for the attainment and maintenance of NAAQS standards. On October 30, 2020, CARB also accepted SCAG’s determination that the SCS met the applicable state greenhouse gas emissions targets. The 2020-2045 RTP/SCS will be incorporated into the forthcoming 2022 AQMP.

SCAQMD Air Quality Guidance Documents. The SCAQMD published the CEQA Air Quality Handbook (approved by the AQMD Governing Board in 1993) to provide local governments with guidance for analyzing and mitigating project-specific air quality impacts. The CEQA Air Quality Handbook provides standards, methodologies, and procedures for conducting air quality analyses. However, the SCAQMD is currently in the process of replacing the CEQA Air Quality Handbook with the Air Quality Analysis Guidance Handbook. While this process is underway, the SCAQMD has provided supplemental guidance on the SCAQMD website.

The SCAQMD has also adopted land use planning guidelines in its Guidance Document for Addressing Air Quality Issues in General Plans and Local Planning, which considers impacts to sensitive receptors from facilities that emit TAC emissions. SCAQMD’s siting distance recommendations are the same as those provided by CARB (e.g., a 500-foot siting distance for sensitive land uses proposed in proximity to freeways and high-traffic roads, and the same siting criteria for distribution centers and dry cleaning facilities). The
SCAQMD's document introduces land use-related policies that rely on design and distance parameters to minimize emissions and lower potential health risk. SCAQMD's guidelines are voluntary initiatives recommended for consideration by local planning agencies.

The SCAQMD has published a guidance document called the *Final Localized Significance Threshold Methodology* for CEQA evaluations that is intended to provide guidance when evaluating the localized effects from mass emissions during construction or operation of a project. The SCAQMD adopted additional guidance regarding PM2.5 emissions in a document called *Final Methodology to Calculate Particulate Matter (PM)2.5 and PM2.5 Significance Thresholds*. The latter document has been incorporated by the SCAQMD into its CEQA significance thresholds and *Final Localized Significance Threshold Methodology*.

**SCAQMD Rules and Regulations.** The SCAQMD has adopted several rules and regulations to regulate sources of air pollution in the Air Basin and to help achieve air quality standards for projects, which include, but are not limited to the following:

**Regulation IV – Prohibitions:** This regulation sets forth the restrictions for visible emissions, odor nuisance, fugitive dust, various air emissions, fuel contaminants, start-up/shutdown exemptions and breakdown events. The following is a list of rules which apply to the reasonably anticipated development of the Proposed Plan:

- **Rule 401 – Visible Emissions:** This rule states that a person shall not discharge into the atmosphere from any single source of emission whatsoever any air contaminant for a period or periods aggregating more than three minutes in any one hour which is as dark or darker in shade as that designated No. 1 on the Ringelmann Chart or of such opacity as to obscure an observer's view.

- **Rule 402 – Nuisance:** This rule states that a person shall not discharge from any source whatsoever such quantities of air contaminants or other material which cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public, or which endanger the comfort, repose, health or safety of any such persons or the public, or which cause, or have a natural tendency to cause, injury or damage to business or property.

---

3.0 Greenhouse Gas

- **Rule 403 – Fugitive Dust:** This rule requires projects to prevent, reduce or mitigate fugitive dust emissions from a site. Rule 403 restricts visible fugitive dust to the project property line, restricts the net PM10 emissions to less than 50 micrograms per cubic meter (µg/m³) and restricts the tracking out of bulk materials onto public roads. Additionally, projects must utilize one or more of the best available control measures (identified in the tables within the rule). Mitigation measures may include adding freeboard to haul vehicles, covering loose material on haul vehicles, watering, using chemical stabilizers and/or ceasing all activities. Finally, a contingency plan may be required if so determined by the U.S. EPA.

**Regulation XI – Source Specific Standards:** Regulation XI sets emissions standards for specific sources. The following is a list of rules which may apply to reasonably anticipated activities of the Ordinance:

- **Rule 1186 – PM10 Emissions from Paved and Unpaved Roads, and Livestock Operations:** This rule applies to owners and operators of paved and unpaved roads and livestock operations. The rule is intended to reduce PM10 emissions by requiring the cleanup of material deposited onto paved roads, use of certified street sweeping equipment, and treatment of high-use unpaved roads (see also Rule 403).

- **Rule 1148 - Thermally Enhanced Oil Recovery Wells:** This rule states that No person shall operate a steam drive well unless the ROG emissions from the well are 4.5 pounds per day or less; or if steam drive wells are connected to a vapor control system, ROG emissions from the control system shall average no more than 4.5 pounds per day per connected well.

- **Rule 1148.1 - Oil and Gas Extraction Wells:** This rule includes requirements for well operators that aim to reduce emissions of volatile organic compounds (VOCs), toxic air contaminants (TAC) emissions and Total Organic Compounds (TOC) from the operation and maintenance of wellheads, well cellars, and the handling of produced gas at oil and gas extraction facilities to assist in reducing regional ozone levels and to prevent public nuisance and possible detriment to public health caused by exposure to such emissions.

- **Rule 1148.2 - Notification and Reporting Requirements for Oil and Gas Wells and Chemical Suppliers:** This rule requires operators of an onshore oil or gas well shall electronically notify the Executive Officers prior to the start of drilling, well completion, or rework of an onshore oil or gas well.

**Regulation XIV – Toxics and Other Non-Criteria Pollutants:** Regulation XIV sets requirements for new permit units, relocations, or modifications to existing permit units which emit toxic air contaminants or other non-criteria pollutants. The following is a list of rules which may apply to reasonably anticipated activities of the Ordinance:
• **Rule 1470 – Requirements for Stationary Diesel-Fueled Internal Combustion and Other Compression Ignition Engines:** This rule applies to stationary compression ignition (CI) engines greater than 50 brake horsepower and sets limits on emissions and operating hours. In general, new stationary emergency standby diesel-fueled engines greater than 50 brake horsepower are not permitted to operate more than 50 hours per year for maintenance and testing.

**Idle Well Regulations**

In California, an idle well is a well that has not been used for two years or more and has not yet been properly plugged and abandoned (sealed and closed). An operator in possession of any idle well is required to either submit an annual idle well fee for each well that was idle at any time in the last calendar year or file an Idle Well Management Plan (IWMP) for the elimination of all of the operator’s long-term idle wells. An operator must submit their annual idle well fees or IWMP by May 1 of each year. The requirements for both can be found in PRC Section 3206. If an operator does not have an IWMP, the annual idle well fees the operator must pay for each of the operator’s idle wells have been increased to reflect the potential costs associated with those wells. The fees are deposited into the Hazardous and Idle-Deserted Well Abatement Fund to help fund the permanent sealing and closure of deserted wells.

**Assembly Bill No. 2729**

Inactive and deserted oil and gas wells that are not maintained can pose threats to groundwater and public safety. The bill expands the definition of “idle well” and encourages operators to file Idle Well Management Plans for either plugging and abandoning long-term idle wells or returning them to production. It also increases idle well fees to help encourage operators to address such wells in their inventories.

**The Oil, Gas, and Geothermal Administrative Fund (OGGA)**

In accordance with Public Resources Code Section 3401 (a) the proceeds of charges levied, assessed, and collected pursuant to Article 7 of the Public Resources Code (commencing with Section 3400), upon the properties of every person operating or owning any interest in the production of a well shall be used exclusively for the support and maintenance of the department charged with the supervision of oil and gas. The proceeds may also be used by public entities, subject to appropriation by the Legislature, for all costs associated with well stimulation treatments and costs of the State Water Resources Control Board and regional water quality control boards as provided in Public Resources Code section 3401 (b).
The Hazardous and Idle-Deserted Well Abatement Fund (HIDWAF)

Idle well fees are deposited into the Hazardous and Idle-Deserted Well Abatement Fund (HIDWAF) and are appropriated to CalGEM to plug and abandon wells to mitigate a hazardous or potentially hazardous condition.

State Abandonment Authority

The Public Resources Code (PRC) provides various presumptions and circumstances under which CalGEM may find that a well has been deserted. If CalGEM determines a well has been idle-deserted, then CalGEM may order the plugging and abandonment of the well. If an operator fails to rebut such presumptions and fails to commence the ordered work, then CalGEM may undertake the plugging and abandonment of the well. CalGEM’s options for funding the plugging and abandonment differs depending upon the solvency of the operator.

Pipeline and Hazardous Materials Safety Administration’s Office of Pipeline Safety (PHMSA)

PHMSA’s mission is to protect people and the environment by advancing the safe transportation of energy and other hazardous materials that are essential to our daily lives. To do this, the agency establishes national policy, sets and enforces standards, educates, and conducts research to prevent incidents. They also prepare the public and first responders to reduce consequences if an incident does occur.

Local

Office of Petroleum and Natural Gas Administration and Safety (OPNGAS)

Established in 2016, OPNGAS is charged with managing petroleum matters for the City and is headed by the Petroleum Administrator. The Petroleum Administrator manages the Office of Petroleum Administration; acts as a technical advisor to Mayor, Council, and City; performs internal & external interagency coordination; leads negotiations for pipeline franchise agreements; completes comprehensive inspections and safety compliance; is the central point of contact for oil and gas; verifies local, state and federal regulations; performs emergency and contingency planning and community and public engagement; and is an oil and gas media spokesperson.

Los Angeles Municipal Code

Section. 13.01 of the Los Angeles Municipal Code (LAMC) establishes provisions for the districts where the drilling of oil wells or the extraction from the wells of oil, gases or other hydrocarbon substances is
permitted. All oil and gas projects require a conditional approval from the City of Los Angeles Department of City Planning and must be located within an oil drilling district.

**Air Quality Element of the Los Angeles General Plan**

Local jurisdictions, such as the City, have the authority and responsibility to reduce air pollution through their land use decision-making authority. Specifically, the City is responsible for the assessment and mitigation of air emissions resulting from its land use decisions. In general, the City of Los Angeles’ General Plan (including the Framework, Air Quality, Mobility 2035, and Health and Wellness Elements) and the City of Los Angeles’ Green New Deal (Sustainable pLAn 2019) contain policies and programs for the protection of the environment and health through improved air quality. These serve to provide additional critical guidance for the betterment of public health for the region and City.

The most directly-related of those plans, the City’s General Plan Air Quality Element, was adopted on November 24, 1992, and sets forth the goals, objectives, and policies which guide the City in its implementation of its air quality improvement programs and strategies. A number of these goals, objectives, and policies are relevant to land use development, and relate to traffic mobility, minimizing particulate emissions from construction activities, discouraging single-occupancy vehicle trips, managing traffic congestion during peak hours, and increasing energy efficiency in City facilities and private developments.

The Air Quality Element establishes six goals:

- Good air quality in an environment of continued population growth and healthy economic structure;
- Less reliance on single-occupant vehicles with fewer commute and non-work trips;
- Efficient management of transportation facilities and system infrastructure using cost-effective system management and innovative demand-management techniques;
- Minimal impacts of existing land use patterns and future land use development on air quality by addressing the relationship between land use, transportation and air quality;
- Energy efficiency through land use and transportation planning, the use of renewable resources and less-polluting fuels and the implementation of conservation measures including passive measures such as site orientation and tree planting; and
- Citizen awareness of the linkages between personal behavior and air pollution and participation in efforts to reduce air pollution
The City is also responsible for the implementation of transportation control measures as outlined in the AQMP. Through capital improvement programs, the City can fund infrastructure that contributes to improved air quality by requiring such improvements as bus turnouts as appropriate, installation of energy-efficient streetlights, and synchronization of traffic signals. In accordance with CEQA requirements and the CEQA review process, the City assesses the air quality impacts of new development projects, requires mitigation of potentially significant air quality impacts by conditioning discretionary permits, and monitors and enforces implementation of such mitigation measures.

**Plan for a Healthy Los Angeles**

The Plan for a Healthy Los Angeles, first adopted by the City Council on March 31, 2015, lays the foundation to create healthier communities for all residents in the City. The City Council subsequently adopted targeted amendments in the Plan For a Healthy Los Angeles on November 24, 2021. The updated Plan satisfies the State requirements (SB 1000) to address environmental justice in the General Plan. As the Health, Wellness, and Equity element of the General Plan, it provides high-level policy vision, along with measurable objectives and implementation programs, to elevate health as a priority for the City’s future growth and development. With a focus on public health and safety and environmental justice, the Plan for a Healthy Los Angeles provides a roadmap for addressing the most basic and essential quality-of-life issues: safe neighborhoods, a clean environment (i.e., improved ambient and indoor air quality), the opportunity to thrive, and access to health services, affordable housing, and healthy and sustainably produced food. The Plan includes policies calling for the reduction of air pollution from stationary and mobile sources, and the protection of communities’ health through land use and design solutions that limit exposure to noxious activities such as oil and gas extraction.

**Safety Element of the Los Angeles General Plan**

The updated Safety Element, adopted by the City Council on November 24, 2021, includes an objective and policies to address climate change, including air quality.

Los Angeles Green Plan

The City seeks to address the issue of global climate change with the *Green LA, An Action Plan to Lead the Nation in Fighting Global Warming* (LA Green Plan). This document outlines the goals and actions the City has established to reduce the generation and emission of GHGs from both public and private activities. According to the LA Green Plan, the City is committed to the goal of reducing emissions of CO2 to 35 percent below 1990 levels. To achieve this, the City will:

- Increase the generation of renewable energy;
- Improve energy conservation and efficiency; and
- Change transportation and land use patterns to reduce dependence on automobiles.

The LA Green Plan is discussed in greater detail in Section 4.7, Greenhouse Gas Emissions.
City of Los Angeles Clean Up Green Up Ordinance

The City of Los Angeles adopted a Clean Up Green Up Ordinance (Ordinance Number 184,245) on April 13, 2016, which among other provisions, includes provisions related to ventilation system filter efficiency in mechanically ventilated buildings. This Ordinance added Sections 95.314.3 and 99.04.504.6 to the Los Angeles Municipal Code (LAMC) and amended Section 99.05.504.5.3 to implement building standards and requirements to address cumulative health impacts resulting from incompatible land use patterns. Section 99.04.504.6, which became effective June 4, 2016, mandates that regularly occupied areas in mechanically ventilated buildings within 1,000 feet of a freeway be provided with air filtration media for outside and return air that meet a Minimum Efficiency Report Value (MERV) of 13. This Ordinance requires that these filters be installed prior to occupancy, and recommendations for maintenance with filters of the same value shall be included in the operation and maintenance manual. The only exception to Section 99.04.504.3 applies to existing mechanical equipment. Additionally, Section 99.05.504.3 states that regularly occupied areas in all mechanically ventilated buildings shall be provided with air filtration media for outside and return air that meets a MERV of 8. An exception is provided for existing mechanical equipment and for new ventilation units meeting certain 2013 California Energy Code requirements. These additions to the LAMC are designed to address cumulative health impacts in highly polluted areas resulting from incompatible land use patterns within the City of Los Angeles.

2.5 THRESHOLDS AND METHODOLOGY

Thresholds of Significance

The impact analysis provided below is based on Appendix G to the State CEQA Guidelines, which indicates that a project would have a significant impact on air quality if it would:

1. Conflict with or obstruct implementation of any applicable air quality plan.

2. Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is nonattainment under an applicable federal or state ambient air quality standard.

3. Expose sensitive receptors to substantial pollutant concentrations.

4. Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people.

The significance criteria established by the applicable air quality management or air pollution control district (SCAQMD) may be relied upon to make the above determinations. According to the SCAQMD, an

27 City of Los Angeles Department of City Planning, Ordinance Number 184,245 Clean Up Green Up, Council File No. 15-1026, adopted April 13, 2016.
air quality impact is considered significant if a project would violate any ambient air quality standard, contribute substantially to an existing or projected air quality violation, or expose sensitive receptors to substantial pollutant concentrations. The SCAQMD has established thresholds of significance for air quality for construction and operational activities of land use development projects, shown in Table 7 – South Coast AQMD Regional Significance Thresholds.

* Ambient air quality thresholds for criteria pollutants based on South Coast AQMD Rule 1303, Table A-2 unless otherwise stated.
* Ambient air quality threshold based on South Coast AQMD Rule 403.

**Localized Significance Thresholds**

The SCAQMD has developed a set of mass emissions rate look-up tables that can be used to evaluate localized impacts that may result from construction and operational-period emissions called localized significance thresholds (LSTs). If the on-site emissions from proposed construction activities are below the emission levels found in the LST mass rate look-up tables for the project site receptor area (SRA), then emissions would not have the potential to cause a significant localized air quality impact. When quantifying mass emissions for LST analysis, only emissions that occur on site are considered. Consistent with SCAQMD LST guidance, emissions from offsite delivery hauling trucks, or employee trips are not considered in the evaluation of localized impacts (SCAQMD 2008).

The proposed Ordinance is citywide and thus multiple SRAs and LSTs would be applicable. Therefore, *Table 8, Local Significance Thresholds By SRA – Pounds per Day* shows the LST screening thresholds for all SRAs within the City.

Note: All LSTs presented are for a 1-acre site with receptors located at a distance of 25 meters. These LSTs are the most restrictive for each SRA, resulting in a conservative analysis of project impacts.

### Methodology

Although not regulated by the Ordinance, well abandonment is a reasonably foreseeable outcome for many of the wells currently operating in the City, although as stated previously, no specific timeline for abandonment currently exists and the Ordinance does not include any regulations related to the timing of the abandonment of oil wells. As such, for purposes of this analysis, there are two distinct phases that would have the potential to change air quality emissions at locations in proximity to oil and gas wells.
3.0 Greenhouse Gas

throughout the City: 1) Short-term and temporary abandonment related activities, and 2) Long-term changes to air quality attributable to the cessation of oil and gas extraction and operations.

Air quality impacts were evaluated in accordance with the methodologies recommended by CARB and the SCAQMD. Air Quality emissions associated with short-term and temporary abandonment related activities were calculated using CalEEMod. Because these emissions would be short-term and temporary, they have been compared to SCAQMD’s regional and localized significance thresholds. Long-term changes to air quality attributable to the cessation of oil and gas extraction and operations have been characterized quantitively and qualitatively, and have been compared to SCAQMD’s thresholds of significance as appropriate.

2.6 PROJECT IMPACTS

AQ Impact 1 Would implementation of the project conflict with or obstruct implementation of any applicable air quality plan? (Less than Significant).

As part of its enforcement responsibilities, the EPA requires each state with nonattainment areas to prepare and submit a SIP that demonstrates the means to attain the federal standards. The SIP must integrate federal, state, and local plan components and regulations to identify specific measures to reduce pollution in nonattainment areas, using a combination of performance standards and market-based programs. Similarly, under state law, the CCAA requires an air quality attainment plan to be prepared for areas designated as nonattainment with regard to the federal and state ambient air quality standards. Air quality attainment plans outline emissions limits and control measures to achieve and maintain these standards by the earliest practical date.

As discussed previously, the 2016 AQMP was drafted by the SCAQMD and was developed in effort with CARB, SCAG, and the U.S. EPA to establish a program of rules and regulations to reduce air pollutant emissions to achieve CAAQS and NAAQS. The plan’s pollutant control strategies are based on SCAG’s Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS). While SCAG adopted the updated 2020-2045 RTP/SCS in September 2020, it has not been incorporated into an applicable air quality plan.

Criteria for determining consistency with the AQMP are defined in Chapter 12, Section 12.2 and Section 12.3 of the SCAQMD’s 1993 CEQA Air Quality Handbook, and include the following:

• Consistency Criterion No. 1: The project will not result in an increase in the frequency or severity of an existing air quality violation, or cause or contribute to new violations, or delay the timely attainment of air quality standards or the interim emissions reductions specified in the AQMP.

• Consistency Criterion No. 2: The project will not exceed the assumptions in the AQMP or increments based on the years of the project build-out phase.

The violations to which Consistency Criterion No. 1 refers are the CAAQS and the NAAQS. As evaluated under AQ Impact 2 below, the Ordinance would not exceed the short-term standards or long-term standards and, thus, would not have the potential to violate any air quality standards. Thus, the Ordinance would be consistent with first criterion.

With respect to Consistency Criterion No. 2, the 2016 AQMP contains air pollutant reduction strategies based on SCAG’s growth forecasts, and SCAG’s growth forecasts were defined in consultation with local governments and with reference to local general plans. The Ordinance would not result in any changes to housing or population forecasts for the City or the region as a whole. Therefore, the Ordinance would not exceed the assumptions utilized to develop the 2016 AQMP and the Ordinance would be consistent with the second criterion. As such, because the Ordinance would be consistent with the criteria for demonstrating consistency with the AQMP, the Ordinance would not have the potential to conflict with or obstruct implementation of any applicable air quality plan and this impact is less than significant.

AQ Impact 2 Would implementation of the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is nonattainment under an applicable federal or state ambient air quality standard? (Less than Significant).

A project may have a significant impact if project-related emissions would result in a cumulatively considerable net increase for a criteria pollutant for which the region in nonattainment under applicable federal or state ambient air quality standards. The cumulative analysis of air quality impacts follows the SCAQMD’s guidance such that construction or operational project emissions will be considered cumulatively considerable if project-specific emissions exceed an applicable SCAQMD recommended threshold.

Short-Term and Temporary Air Quality Emissions

The closure of oil and gas wells entails plugging the wells in place in accordance with California Statutes and Regulations and all other applicable requirements as overseen by CalGEM. The process of well abandonment will be determined on a case-by-case basis under the regulatory supervision of CalGEM and
the LAFD and will depend on individual site conditions such as type and depth of well. However, for the purposes of this environmental analysis, several generalized assumptions have been made based upon standard industry practice, existing regulations governing well abandonment, and case studies. While plugging and abandonment varies by well, there is a consistent set of procedures that are followed. Generally, the drill site’s existing drilling or maintenance rig will be used to abandon the well and remove equipment from the well. Well equipment will be removed from the site by truck. Cement trucks will also arrive onsite to fill the well at various depths over a span of several days. An operator may use in excess of 2,500 cubic feet of cement for one abandonment. The process entails removing equipment and filling the well with cement at different phases in order to ensure that it is safe to abandon the well at varying depths. At the end of each work day, the well site is closed and the rig is shut down in order to resume operations the following work day. See Section 1.2, Project Description, for the anticipated steps of well abandonment.

For purposes of estimating potential air quality associated with abandonment activities, it is assumed each well abandonment would last approximately two weeks (i.e., 10 workdays), and on-site equipment would include one workover rig, one cement pump truck, one welder, and one tractor/loader/backhoe. On-road activity was estimated to include 10 worker trips per day (travel to and from the well locations) and 3 truck trips per day. This analysis conservatively assumes that all pieces of equipment would operate concurrently on a peak day, presenting a worst-case impact scenario.

Abandonment activities would generate short-term emissions of criteria air pollutants. The criteria pollutants of primary concern include ozone-precursor pollutants (i.e., ROG and NOx), PM10, and PM2.5. Abandonment-generated emissions are short term and of temporary duration, lasting only as long as activities occur, but would be considered a significant air quality impact if the volume of pollutants generated exceeds the SCAQMD’s thresholds of significance. Abandonment activities would be required to comply with all applicable SCAQMD Rules, which may include but not be limited to: Rule 401 (Visible Emissions), Rule 402 (Nuisance), Rule 403 (Fugitive Dust – Trucks and Unpaved Roads), Rule 1186 (PM10 Emissions from Paved and Unpaved Roads), Rule 1148 (Thermally Enhanced Oil Recovery Wells), Rule 1148.1 (Oil and Gas Extraction Wells), Rule 1148.2 (Notification and Reporting Requirements for Oil and Gas Wells and Chemical Suppliers), and Rule 1470 (Requirements for Stationary Diesel-Fueled Internal Combustion and Other Compression Ignition Engines). These Rules are discussed in greater detail in Section 2.4, Regulatory Framework, above. The estimated maximum daily abandonment related air

---

As shown in **Table 8**, on a per-well basis, the peak daily emissions generated during abandonment would not exceed any of the regional emission thresholds recommended by the SCAQMD. As discussed previously, abandonment of individual emission wells may occur at any time during the 20-year timeframe, and potentially beyond the 20-year timeframe. It would be speculative to assess how many wells would be abandoned during a given year, month, or peak day. Nevertheless, for illustrative purposes, based on the peak daily emissions identified in **Table 8** for a single well, it is possible for up to approximately 19 wells to be abandoned concurrently (i.e., overlapping on a peak day) without exceeding any of the regional emission thresholds recommended by the SCAQMD. Therefore, the Ordinance would not result in a cumulatively considerable net increase of any criteria air pollutant for which the region is in nonattainment and this impact is less than significant.

**Long-Term Air Quality Emissions**

As discussed previously, oil and gas operations throughout the City contribute to local and regional air quality conditions. Upon full implementation of the Ordinance, existing emission sources associated with oil and gas wells would no longer occur, and long-term air quality emissions would be decreased compared to existing emissions associated with oil and gas extraction throughout the City. The following discussion identifies the potential air quality emissions that may be avoided as a result of the Ordinance.

Long-term air quality emissions fall into two general categories: 1) worker commutes and 2) fugitive emissions. Typical emissions from worker commutes (i.e., motor vehicle trips) include ROG, NOx, CO, SOx, PM10 and PM2.5. Fugitive emissions include ROGs (also referred to as volatile organic compounds)
which may include but not be limited to pentane, n-pentane, hexane, ethane, and other longer-chain hydrocarbons. In general, fugitive emissions from oil and gas activities may be attributed to the following primary types of sources: fugitive equipment leaks; process venting; evaporation losses; disposal of waste gas streams (e.g., by venting or flaring), and accidents and equipment failures. Fugitive leaks from piping and equipment are typically small yet detectable emissions from equipment where there are joints, flanges, and seals. Although joints and flanges are typically bolted, small amounts of hydrocarbons may be emitted through leaky joints.

It should be noted that fugitive emissions are difficult to quantify with a high degree of accuracy and there remains substantial uncertainty in the emission factors and calculation methodologies for oil and gas activities. This is due to the numerous types of sources and many variables to be considered. The key emission assessment issues are: (a) use of simple extraction based emission factors is susceptible to excessive errors; (b) use of rigorous bottom-up approaches requires expert knowledge to apply and relies on detailed data which may be difficult and costly to obtain; and (c) measurement programs are time consuming and very costly to perform. Nevertheless, Table 10, Avoided Oil & Gas Air Quality Emissions – Pounds per Day, has been included in an effort to illustrate the potential scope of air quality emissions that may be avoided as a result of the Ordinance. Due to the programmatic nature of this analysis and the many variables at each oil and gas well throughout the City, the quantified estimates in Table 9 are included as a good-faith effort for illustrative purposes.

*Source: Impact Sciences, September 2022. See Appendix B to this report.*

Furthermore, while it is clear the Ordinance would result in a net benefit to local and regional air quality conditions, the degree to which air quality emissions may be avoided under the Ordinance is not the basis for the impact determination. Because the Ordinance would reduce long-term air quality emissions

---

30 Intergovernmental Panel on Climate Change, Good Practice Guidance and Uncertainty Management in National Greenhouse Gas Inventories, Fugitive Emissions From Oil and Natural Gas Activities.

31 See Appendix B to this report for further information related to calculations and assumptions utilized to prepare these estimates.
compared to existing emissions associated with oil and gas extraction throughout the City, the Ordinance would not result in a cumulatively considerable net increase of any criteria air pollutant for which the region is in nonattainment and this impact is *less than significant*.

**AQ Impact 3**

Would implementation of the project expose sensitive receptors to substantial air pollutant concentrations? *(Less than Significant)*.

### Localized Air Quality Emissions

The SCAQMD has developed localized significance thresholds (LST) that represent the maximum emissions from a project that are not expected to cause or contribute to an exceedance of the applicable federal or State ambient air quality standard. LSTs are provided for each source receptor area (SRA) and various distances from the source of emissions. As the Ordinance is citywide, activities under the Ordinance could occur in parts of eight SRAs in the Coastal, Metropolitan, San Fernando Valley, and San Gabriel Valley areas. \(^{32}\) The LSTs applicable to the Ordinance were presented previously in Table 7. The closest receptor distance in the SCAQMD’s mass rate look-up tables is 25 meters. Projects that are located closer than 25 meters to the nearest receptor are directed to use the LSTs for receptors located within 25 meters. Abandonment activities would generate short-term localized emissions of criteria air pollutants. While abandonment-generated emissions are short term and of temporary duration, the emissions could be considered a significant air quality impact if the pollutants exceed the SCAQMD’s LSTs.

As shown in Table 11, **Localized Oil & Gas Well Abandonment Emissions (Per Well) – Pounds Per Day**, the Ordinance would not exceed any of the identified localized thresholds of significance during abandonment. Therefore, the Ordinance would not expose sensitive receptors to substantial air pollutant concentrations and these impacts would be *less than significant*.

---

\(^{32}\) The SRAs include: SRA 1, described as Central Los Angeles County; SRA 2, described as Northwest Los Angeles County Coastal; SRA 3, described as Southwest Los Angeles County Coastal; SRA 4, described as South Los Angeles County Coastal; SRA 6, described as West San Fernando Valley; SRA 7, described as East San Fernando Valley; SRA 8, described as West San Gabriel Valley; and SRA 12, described as South Central Los Angeles County.

Source: Impact Sciences, September 2022. See Appendix B to this report.

**Diesel Particulate Matter**

The use of diesel-powered equipment and trucks during abandonment would result in the generation of diesel particulate matter (diesel PM) emissions. The amount to which the sensitive receptors are exposed (a function of concentration and duration of exposure) is the primary factor used to determine health risk (i.e., potential exposure to TAC emission levels that exceed applicable standards). Health-related risks associated with diesel-exhaust emissions are primarily linked to long-term exposure and the associated risk of contracting cancer.

The use of diesel-powered construction equipment and trucks would be temporary and episodic. The duration of exposure would be short and exhaust from construction equipment dissipates rapidly. Current methodologies for conducting health risk assessments are associated with long term exposure periods (9, 30, and 70 years). As discussed previously, typical abandonment activities are expected to last for approximately 10 work days. Therefore, short-term abandonment activities would not have the potential to generate a significant health risk. Furthermore, abandonment activities would be subject to and would comply with California regulations limiting the idling of heavy-duty construction equipment to no more than 5-minutes, which would further reduce nearby sensitive receptors’ exposure to temporary and variable DPM emissions.\(^{33}\) For these reasons, DPM emissions associated with abandonment would not expose sensitive receptors to substantial amounts of air toxics and this impact is less than significant.

\(^{33}\) California Air Resources Board. 2015. Frequently Asked Questions Regulation for In-Use Off-Road Diesel-Fueled (Off-Road Regulation). Available online at: https://www3.arb.ca.gov/msprog/ordiesel/faq/idlepolicyfaq.pdf, accessed August 16, 2022
AQ Impact 4 Would the proposed project include sources that could create other emissions (such as those leading to odors) adversely affecting a substantial number of people? (Less than Significant).

The SCAQMD CEQA Air Quality Handbook (1993) identifies certain land uses as sources of odors. These land uses include agriculture (farming and livestock), wastewater treatment plants, food processing plants, chemical plants, composting facilities, refineries, landfills, dairies, and fiberglass molding.

Existing oil and gas operations throughout the City contribute to localized emissions that lead to odors. Several compounds associated with the oil and gas industry can produce nuisance odors. Sulfur compounds found in oil and gas have very low odor detection levels. Many volatile compounds found in oil and gas (e.g., pentane, n-pentane, hexane, ethane, and other longer-chain hydrocarbons) typically have a petroleum or gasoline-type odor. An odor “event” is generally considered a scenario where odors are released and negatively impact the surrounding community, measured as generating odor complaints to the SCAQMD and confirmed by the SCAQMD as attributable to a specific source.

During abandonment activities, the two primary sources of potential odors are fugitive well emissions and diesel exhaust from equipment and trucks. As abandonment activities are anticipated to last approximately 10 work days, these emission sources and associated odors would be temporary and intermittent, and affecting only those receptors located in proximity to the wells. In addition, abandonment activities would be subject to SCAQMD Rule 402 (Nuisance) and California Code of Regulations, Title 13, sections 2449(d)(3) and 2485, which minimizes the idling time of construction equipment either by shutting it off when not in use or by reducing the time of idling to no more than five minutes. These regulations would serve to minimize temporary and intermittent odors. As oil and gas operations cease, existing oil and gas well emissions leading to odors would no longer occur, and long-term odors would be decreased compared to existing conditions. Therefore, the Ordinance would not create other emissions leading to odors adversely affecting a substantial number of people, and this impact is less than significant.
3.0 GREENHOUSE GAS

3.1 GREENHOUSE GAS SETTING

Global climate change refers to any significant change in climate measurements, such as temperature, precipitation, or wind, lasting for an extended period (i.e., decades or longer). Climate change may result from:

- Natural factors, such as changes in the sun’s intensity or slow changes in the Earth’s orbit around the sun;
- Natural processes within the climate system (e.g., changes in ocean circulation, reduction in sunlight from the addition of GHG and other gases to the atmosphere from volcanic eruptions); and
- Human activities that change the atmosphere’s composition (e.g., through burning fossil fuels) and the land surface (e.g., deforestation, reforestation, urbanization, desertification).

In recent decades, changes in climate have caused impacts on natural and human systems on all continents and across the oceans. Impacts are due to observed climate change, irrespective of its cause, indicating the sensitivity of natural and human systems to changing climate. Continuing changes to the global climate system and ecosystems, and to California, are projected to include:

- Rapidly diminishing sea ice and mountain snowpack levels, thereby increasing sea levels and sea surface evaporation rates with a corresponding increase in tropospheric water vapor due to the atmosphere’s ability to hold more water vapor at higher temperatures;
- Rising average global sea levels primarily due to thermal expansion and the melting of glaciers, ice caps, and ice sheets;
- Changing weather patterns, including changes to precipitation, ocean salinity, and wind patterns, and more energetic aspects of extreme weather, including droughts, heavy precipitation, heat waves, extreme cold, and the intensity of tropical cyclones;

3.0 Greenhouse Gas Impact Sciences, Inc.

- Changing levels in snowpack, river flow and sea levels indicating that climate change is already affecting California’s water resources;

- Dry seasons that start earlier and end later, evoking more frequent and intense wildland fires; and

- Increasing demand for electricity due to rising temperatures.

The natural process through which heat is retained in the troposphere is called the “greenhouse effect.” Various gases in the Earth’s atmosphere, classified as atmospheric greenhouse gases, play a critical role in determining the Earth’s surface temperature. Solar radiation enters Earth’s atmosphere as short wave radiation. It travels through the atmosphere without warming it and is absorbed by the Earth’s surface. When the Earth re-emits this radiation back toward space, the radiation changes to long wave radiation. GHGs are transparent to incoming short wave solar radiation but absorb outgoing long wave radiation. As a result, radiation that otherwise would escape back into space is now retained, warming the atmosphere. This phenomenon is known as the greenhouse effect.

Greenhouse Gas Compounds

California State law defines GHGs to include the following six compounds:

- **Carbon Dioxide** (CO₂) is an odorless, colorless GHG, which has both natural and man-made sources. Natural sources include the following: decomposition of dead organic matter; respiration of bacteria, plants, animals, and fungus; evaporation from oceans; and volcanic outgassing; man made sources of CO₂ are burning coal, oil, natural gas, and wood.

- **Methane** (CH₄) is a flammable gas and is the main component of natural gas. When one molecule of CH₄ is burned in the presence of oxygen, one molecule of CO₂ and two molecules of water are released. There are no ill health effects from CH₄. A natural source of CH₄ is the anaerobic decay of organic matter. Geological deposits, known as natural gas fields, also contain CH₄, which is extracted for fuel. Other sources are from landfills, fermentation of manure, and cattle.

38 California Environmental Protection Agency (Cal EPA). 2010. Climate Action Team Report to Governor Schwarzenegger and the Legislature.
40 The troposphere is the bottom layer of the atmosphere, which varies in height from the Earth’s surface from 6- to 7-miles).
3.0 Greenhouse Gas

- **Nitrous Oxide** (N₂O) is a colorless GHG. High concentrations can cause dizziness, euphoria, and sometimes slight hallucinations. N₂O is produced by microbial processes in soil and water, including those reactions which occur in fertilizer containing nitrogen. In addition to agricultural sources, some industrial processes (fossil fuel-fired power plants, nylon production, nitric acid production, and vehicle emissions) also contribute to its atmospheric load. It is used in rocket engines, race cars, and as an aerosol spray propellant.

- **Hydrofluorocarbons** (HFCs) are synthetic man-made chemicals that are used as a substitute for chlorofluorocarbons (CFCs) for automobile air conditioners and refrigerants. CFCs are gases formed synthetically by replacing all hydrogen atoms in methane or ethane with chlorine and/or fluorine atoms. CFCs are nontoxic, nonflammable, insoluble, and chemically unreactive in the troposphere (the level of air at Earth’s surface). CFCs were first synthesized in 1928 for use as refrigerants, aerosol propellants, and cleaning solvents. Because they destroy stratospheric ozone, the production of CFCs was stopped as required by the Montreal Protocol in 1987.

- **Perfluorocarbons** (PFCs) have stable molecular structures and do not break down through the chemical processes in the lower atmosphere. High-energy ultraviolet rays about 60 kilometers above Earth’s surface are able to destroy the compounds. PFCs have very long lifetimes, between 10,000 and 50,000 years. Two common PFCs are tetrafluoromethane and hexafluoroethane. The two main sources of PFCs are primary aluminum production and semiconductor manufacture.

  - **Sulfur Hexafluoride** (SF₆) is an inorganic, odorless, colorless, non-toxic, and nonflammable gas. SF₆ is used for insulation in electric power transmission and distribution equipment, in the magnesium industry, in semiconductor manufacturing, and as a tracer gas for leak detection.

- **Black Carbon** is the most strongly light-absorbing component of particulate matter emitted from burning fuels such as coal, diesel, and biomass. It contributes to global warming, but is a solid particle or aerosol, not a gas.

**Global Warming Potential**

Global Warming Potential (GWP) is one type of simplified index based upon radiative properties that is used to estimate the potential future impacts of emissions of different gases upon the climate system in a relative sense. GWP is based on a number of factors, including the radiative efficiency (heat-absorbing ability) of each gas relative to that of CO₂, as well as the decay rate of each gas (the amount removed from the atmosphere over a given number of years) relative to that of CO₂. A summary of the atmospheric lifetime and GWP of selected gases is presented in Table 12, Atmospheric Lifetimes and Global Warming Potential for Greenhouse Gases.

Note: “Global Warming Potential” is a relative measure of how much heat a GHG traps in the atmosphere, as compared to CO₂.

Potential Effects of Climate Change

Globally, climate change has the potential to affect numerous environmental resources though potential impacts related to future air temperatures and precipitation patterns. Scientific modeling predicts that continued GHG emissions at or above current rates would induce more extreme climate changes during the 21st century than were observed during the 20th century. Long-term trends have found that each of the past three decades has been warmer than all the previous decades in the instrumental record, and the decade from 2000 through 2010 has been the warmest. The observed global mean surface temperature for the decade from 2006 to 2015 was approximately 0.87 °C (0.75°C to 0.99°C) higher than the average over the period from 1850 to 1900. Furthermore, several independently analyzed data records of global and regional Land-Surface Air Temperature obtained from station observations are in agreement that air and sea surface temperatures have increased. Due to past and current activities, anthropogenic GHG emissions are increasing global mean surface temperature at a rate of 0.2°C per decade. In addition to these findings, there are identifiable signs that global warming is currently taking place, including substantial ice loss in the Arctic over the past two decades.41,42

According to California’s Fourth Climate Change Assessment, statewide temperatures from 1986 to 2016 were approximately 1°F to 2°F higher than those recorded from 1901 to 1960. Potential impacts of climate change in California may include loss in water supply from snowpack, sea level rise, more extreme heat days per year, more large forest fires, and more drought years. While there is growing scientific consensus

about the possible effects of climate change at a global and statewide level, current scientific modeling tools are unable to predict what local impacts may occur with a similar degree of accuracy. In addition to statewide projections, California’s Fourth Climate Change Assessment includes regional reports that summarize climate impacts and adaptation solutions for nine regions of the state as well as regionally-specific climate change case studies. Below is a summary of some of the potential effects that could be experienced in California as a result of climate change.

**Air Quality.** Higher temperatures, which are conducive to air pollution formation, could worsen air quality in California. Climate change may increase the concentration of ground-level ozone, but the magnitude of the effect, and therefore its indirect effects, are uncertain. As temperatures have increased in recent years, the areas burned by wildfires throughout the state has increased, and wildfires have been occurring at higher elevations in the Sierra Nevada Mountains. If higher temperatures continue to be accompanied by an increase in the incidence and extent of large wildfires, air quality would worsen. However, if higher temperatures are accompanied by wetter, rather than drier conditions, the rains would tend to temporarily clear the air of particulate pollution and reduce the incidence of large wildfires, thereby ameliorating the pollution associated with wildfires. Additionally, severe heat accompanied by drier conditions and poor air quality could increase the number of heat-related deaths, illnesses, and asthma attacks throughout the state.

**Water Supply.** Analysis of paleoclimatic data (such as tree-ring reconstructions of stream flow and precipitation) indicates a history of naturally and widely varying hydrologic conditions in California and the west, including a pattern of recurring and extended droughts. Uncertainty remains with respect to the overall impact of climate change on future precipitation trends and water supplies in California. For example, many southern California cities have experienced their lowest recorded annual precipitation twice within the past decade; however, in a span of only two years, Los Angeles experienced both its driest and wettest years on record. This uncertainty regarding future precipitation trends complicates the analysis of future water demand, especially where the relationship between climate change and its potential effect on water demand is not well understood. However, the average early spring snowpack in the western United States, including the Sierra Nevada Mountains, decreased by about 10 percent during the last century. During the same period, sea level rose over 5.9 inches along the central and southern California coast. The Sierra snowpack provides the majority of California’s water supply by accumulating

---

3.0 Greenhouse Gas

Snow during the state’s wet winters and releasing it slowly during the state’s dry springs and summers. A warmer climate is predicted to reduce the fraction of precipitation falling as snow and result in less snowfall at lower elevations, thereby reducing the total snowpack.48,49 The State of California projects that average spring snowpack in the Sierra Nevada and other mountain catchments in central and northern California will decline by approximately 66 percent from its historical average by 2050.50

**Hydrology and Sea Level Rise.** As discussed above, climate change could potentially affect the amount of snowfall, rainfall, and snowpack; the intensity and frequency of storms; flood hydrographs (flash floods, rain or snow events, coincidental high tide and high runoff events); sea level rise and coastal flooding; coastal erosion; and the potential for saltwater intrusion. Climate change has the potential to induce substantial sea level rise in the coming century.51 The rising sea level increases the likelihood and risk of flooding. The rate of increase of global mean sea levels over the 2001-2010 decade, as observed by satellites, ocean buoys and land gauges, was approximately 3.2 millimeter per year, which is double the observed 20th century trend of 1.6 millimeter per year.52 As a result, global mean sea levels averaged over the last decade were about 8 inches higher than those of 1880.53

Sea levels are rising faster now than in the previous two millennia, and the rise is expected to accelerate, even with robust GHG emission control measures. The most recent Intergovernmental Report on Climate Change (IPCC) report predicts a mean sea–level rise of 10 to 37 inches by 2100.54 A rise in sea levels could completely erode 31 to 67 percent of southern California beaches, result in flooding of approximately 370 miles of coastal highways during 100-year storm events, jeopardize California’s water supply due to salt water intrusion, and induce groundwater flooding and/or exposure of buried infrastructure.55 In addition, increased CO₂ emissions can cause oceans to acidify due to the carbonic acid it forms. Increased storm intensity and frequency could affect the ability of flood-control facilities, including levees, to handle storm events.

---

Agriculture. California has a $50 billion annual agricultural industry that produces over a third of the country’s vegetables and two-thirds of the country’s fruits and nuts. Higher CO₂ levels can stimulate plant production and increase plant water-use efficiency. However, if temperatures rise and drier conditions prevail, certain regions of agricultural production could experience water shortages of up to 16 percent; water demand could increase as hotter conditions lead to the loss of soil moisture; crop-yield could be threatened by water-induced stress and extreme heat waves; and plants may be susceptible to new and changing pest and disease outbreaks. In addition, temperature increases could change the time of year certain crops, such as wine grapes, bloom or ripen, and thereby affect their quality.

Ecosystems and Wildlife. Climate change and the potential resulting changes in weather patterns could have ecological effects on a global and local scale. Increasing concentrations of GHGs are likely to accelerate the rate of climate change. Scientists project that the annual average maximum daily temperatures in California could rise by 4.4 to 5.8°F in the next 50 years and by 5.6 to 8.8°F in the next century. Soil moisture is likely to decline in many regions, and intense rainstorms are likely to become more frequent. Rising temperatures could have four major impacts on plants and animals related to (1) timing of ecological events; (2) geographic distribution and range; (3) species’ composition and the incidence of nonnative species within communities; and (4) ecosystem processes, such as carbon cycling and storage.

Statewide GHG Emissions

CalEPA published a report titled Scenarios of Climate Change in California: An Overview (Climate Scenarios report) in February 2006 that, while not adequate for a CEQA project-specific or cumulative analysis, is generally instructive about the future impacts of global warming on California. In addition, on December 2, 2009, the California Natural Resources Agency released its California Climate Adaptation Strategy report that details many vulnerabilities arising from climate change with respect to matters such as temperature extremes, sea level rise, wildfires, floods and droughts and precipitation changes. According to these reports, substantial temperature increases arising from increased GHG emissions potentially could result in a variety of impacts to the people, economy, and environment of California. This includes an associated projected increase in extreme conditions, with the severity of the impacts depending upon actual future emissions of GHGs and associated warming. Under the emissions scenarios of the Climate Scenarios report, the impacts of global climate change in California have the potential to include,

but are not limited to, the areas of public health, water resources, agriculture, forests and landscapes, and rising sea levels. The potential effects of climate change are detailed in the section below.

CARB publishes an annual statewide emissions inventory trends report with the most recent iteration covering the years 2000–2019. Emission inventory trends over the past decade demonstrate that GHG emissions have decreased by eight percent over that period, as shown in Table 13.62 The units of GHG emissions presented in the table are in million metric tons of carbon dioxide equivalents (MMTCO₂e). The transportation sector represents California’s largest source of GHG emissions and contributed approximately 40 percent of total annual emissions in 2019.

<table>

The data in Table 14 convey a steady increase in GHG emissions from the transportation sector between 2013 and 2017, followed by sequential years of reductions in 2018 and 2019. This recent decline is consistent with the long-term direction of transportation-related GHG emissions resulting from statewide reduction initiatives, as evidenced by 2019 transportation emissions being lower than 2009 levels despite the growing population. Transportation sector GHG emissions have declined as a material benefit of more stringent fuel economy standards and enhanced alternative fuel vehicle programs mandated and enforced by the CARB.
Local GHG Emissions

As part of the Sustainable City pLAn, the City began tracking its GHG emissions inventory and progress in control strategies to reduce emissions in annual reports. L.A.’s Green New Deal is an expanded vision of the Sustainable City pLAn. Consistent with state-level regulatory initiatives to reduce GHG emissions, the City selected the 1990 GHG emissions level of 54.1 MMTCO₂e as the comparative baseline for determining the efficacy of emission control strategies. According to L.A.’s Green New Deal third Annual Report (2021–2022), the City has reduced GHG emissions to 36 percent below 1990 levels as of 2020.63 Coal generation decreased 25% from 20119 to 2020. The City is striving to be coal-free by 2025. Between 2014 and 2020, the carbon intensity of L.A.’s electricity grid has decreased by 46 percent, and 59 percent compared to a 1990 baseline. Los Angeles utilizes 43 percent renewable energy, and has the goal of reaching 60 percent renewables by 2030 and to be carbon free by 2045.64 The Sustainable City pLAn is described in more detail above under Regulatory Framework.

3.2 REGULATORY FRAMEWORK

International

Intergovernmental Panel on Climate Change. The World Meteorological Organization (WMO) and United Nations Environmental Program (UNEP) established the IPCC in 1988. The goal of the IPCC is to evaluate the risk of climate change caused by human activities. Rather than performing research or monitoring climate, the IPCC relies on peer-reviewed and published scientific literature to make its assessment. While not a regulatory body, the IPCC assesses information (i.e., scientific literature) regarding human-induced climate change and the impacts of human-induced climate change and recommends options to policy makers for the adaptation and mitigation of climate change. The IPCC reports its evaluations in special reports called assessment reports. The latest assessment report (i.e., Fifth Assessment Report, consisting of three working group reports and a synthesis report based on the first three reports) was published in 2013. In its 2013 report, the IPCC stated that global temperature increases since 1951 were extremely likely attributable to man-made activities (greater than 95 percent certainty).65 The IPCC anticipates the release of the Sixth Assessment Report in 2022.66

U.S.–China Climate Agreement. In November 2014, the United States and China made a joint announcement to cooperate on combating climate change and promoting clean energy. In the United States, President Barack Obama announced a climate target to reduce GHG emissions by 26 to 28 percent below 2005 levels by 2025. In China, President Xi Jinping announced a climate target to reduce peak CO₂ emissions by 2030 and to increase the renewable energy share across all sectors to 20 percent by 2030. China will need to build an additional 800 to 1,000 gigawatts of nuclear, wind, solar, and other zero emission generation capacity by 2030 to reach this target. Together, the United States and China have agreed to: expand joint clean energy research and development at the U.S.-China Clean Energy Research Center, advance major carbon capture, use and storage demonstrations, enhance cooperation on HFCs, launch a climate-smart/low-carbon cities initiative, promote trade in green goods, and demonstrate clean energy on the ground.\(^{67}\)

Paris United Nations Framework Convention on Climate Change (Paris Accord). A new international climate change agreement was adopted at the Paris United Nations Framework Convention on Climate Change conference in December 2015. The last two climate conferences in Warsaw (2013) and Lima (2014) decided that countries were to submit their proposed emissions reduction targets for the 2015 conference as “intended nationally determined contributions” prior to the Paris conference. The European Union has committed to an economy-wide, domestic GHG reduction target of 40 percent below 1990 levels by 2030. The United States has set its intended nationally determined contribution to reduce its GHG emissions by 26 to 28 percent below its 2005 level in 2025 and to make best efforts to reduce its emissions by 28 percent. These targets are set with the goal of limiting global temperature rise to well below 2 degrees Celsius and getting to the 80 percent emission reduction by 2050.

In June 2017, the U.S. announced its intent to withdraw from the Paris Accord with an effective date of withdrawal of November 2020. On Friday, February 19, 2021, the United States formally rejoined the Paris Agreement.

In an effort to reach the goals set by the Paris Accord, over 9,000 cities and local governments from 132 countries across the world formed the Global Covenant of Mayors (GCoM) with the goal of collectively reducing 1.3 billion tons of CO₂ emissions per year by 2030.\(^{68}\) 158 cities within the United States joined the GCoM (prior to the US formally rejoining the Paris Accord), including the City of Los Angeles.\(^{69}\)

North American Climate, Clean Energy, and Environment Partnership Action Plan. The North American Climate, Clean Energy, and Environment Partnership Action Plan was announced by Prime Minister Justin Trudeau, President Barack Obama, and President Enrique Peña Nieto on June 29, 2016, at the North American Leaders Summit in Ottawa, Canada. This Action Plan identifies the deliverables to be achieved and activities to be pursued by the three countries as part of this enduring Partnership. The three leaders declared their common vision in a historic North American Climate, Clean Energy, and Environment Partnership, described in a Leaders’ Statement and Action Plan that details the actions our leaders will pursue. These actions include:

- Setting a target to increase clean power to 50 percent of the electricity generated across North America by 2025;
- Reducing methane emissions from the oil and gas sector by 40 to 45 percent by 2025;
- Strengthening standards for energy efficiency and vehicle emissions, including aligning energy efficiency standards that will amount to over four billion per year in annual savings for United States businesses and consumers by 2025;
- Strengthening vehicle efficiency, improving fuel quality, and reducing tailpipe pollutants;
- Affirming their support for joining and implementing the Paris Agreement this year and committing to work together to address climate issues through the Montreal Protocol, International Civil Aviation Organization, G-20, and other forums; and
- Celebrating our strong environmental cooperation, including expanding cooperation on early warning systems for natural disasters, supporting habitat for migratory species including Monarchs and birds, and developing action plans to combat wildlife trafficking.

Federal

Federal Clean Air Act. The United States Environmental Protection Agency (U.S. EPA) is responsible for implementing federal policy to address GHGs. The United States Supreme Court (Supreme Court) ruled in Massachusetts v. Environmental Protection Agency, 127 S.Ct. 1438 (2007), that CO₂ and other GHGs are pollutants under the federal Clean Air Act (CAA), which the U.S. EPA must regulate if it determines they pose an endangerment to public health or welfare. In December 2009, U.S. EPA issued an endangerment finding for GHGs under the Clean Air Act, setting the stage for future regulation.

The Federal Government administers a wide array of public-private partnerships to reduce the GHG intensity generated in the United States. These programs focus on energy efficiency, renewable energy,
methyl and other non-CO₂ gases, agricultural practices, and implementation of technologies to achieve GHG reductions. U.S. EPA implements numerous voluntary programs that contribute to the reduction of GHG emissions. These programs (e.g., the ENERGY STAR labeling system for energy-efficient products) play a significant role in encouraging voluntary reductions from large corporations, consumers, industrial and commercial buildings, and many major industrial sectors.

**Corporate Average Fuel Economy (CAFE) Standards.** In response to the *Massachusetts v. Environmental Protection Agency* ruling, President George W. Bush issued Executive Order 13432 in 2007, directing the U.S. EPA, the United States Department of Transportation (USDOT), and the United States Department of Energy (USDOE) to establish regulations that reduce GHG emissions from motor vehicles, non-road vehicles, and non-road engines by 2008. The National Highway Traffic Safety Administration (NHTSA) subsequently issued multiple final rules regulating fuel efficiency for and GHG emissions from cars and light-duty trucks for model year 2011 and later for model years 2012-2016, and 2017-2021. In March 2020, the USDOT and the U.S. EPA issued the final Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule, which amends existing CAFE standards and tailpipe carbon dioxide emissions standards for passenger cars and light trucks and establishes new standards covering model years 2021 through 2026. These standards set a combined fleet wide average of 36.9 to 37 for the model years affected.

In addition to the regulations applicable to cars and light-duty trucks described above, in 2011 the U.S. EPA and NHTSA announced fuel economy and GHG standards for medium- and heavy-duty trucks for model years 2014–2018. The standards for CO₂ emissions and fuel consumption are tailored to three main vehicle categories: combination tractors, heavy-duty pickup trucks and vans, and vocational vehicles. According to the U.S. EPA, this regulatory program would reduce GHG emissions and fuel consumption for the affected vehicles by 6 to 23 percent over the 2010 baselines. Building on the first phase of standards, in August 2016, the EPA and NHTSA finalized Phase 2 standards for medium and heavy-duty vehicles through model year 2027 that will improve fuel efficiency and cut carbon pollution. The Phase 2 standards are expected to lower CO₂ emissions by approximately 1.1 billion metric tons.

**Energy Independence and Security Act.** The Energy Independence and Security Act of 2007 (EISA) facilitates the reduction of national GHG emissions by requiring the following:

---

71 National Highway Traffic Safety Administration (NHTSA), *Corporate Average Fuel Economy standards.*

72 U.S. EPA, EPA and NHTSA Adopt Standards to Reduce GHG and Improve Fuel Efficiency of Medium- and Heavy-Duty Vehicles for Model Year 2018 and Beyond, August 2016.
• Increasing the supply of alternative fuel sources by setting a mandatory Renewable Fuel Standard (RFS) that requires fuel producers to use at least 36 billion gallons of biofuel in 2022;

• Prescribing or revising standards affecting regional efficiency for heating and cooling products, procedures for new or amended standards, energy conservation, energy efficiency labeling for consumer electronic products, residential boiler efficiency, electric motor efficiency, and home appliances;

• Requiring approximately 25 percent greater efficiency for light bulbs by phasing out incandescent light bulbs between 2012 and 2014; requiring approximately 200 percent greater efficiency for light bulbs, or similar energy savings, by 2020; and

• While superseded by the U.S. EPA and NHTSA actions described above, (i) establishing miles per gallon targets for cars and light trucks and (ii) directing the NHTSA to establish a fuel economy program for medium- and heavy-duty trucks and create a separate fuel economy standard for trucks.

Additional provisions of EISA address energy savings in government and public institutions, promote research for alternative energy, additional research in carbon capture, international energy programs, and the creation of “green jobs.”

Global Change Research Act (1990). In 1990, Congress passed—and the President signed—Public Law 101-606, the Global Change Research Act. The purpose of the legislation was: “...to require the establishment of a United States Global Change Research Program aimed at understanding and responding to global change, including the cumulative effects of human activities and natural processes on the environment, to promote discussions towards international protocols in global change research, and for other purposes.” To that end, the Global Change Research Information Office was established in 1991 to serve as a clearinghouse of information. The Act requires a report to Congress every four years on the environmental, economic, health and safety consequences of climate change; however, the first and only one of these reports to date, the National Assessment on Climate Change, was not published until 2000. In February 2004, operational responsibility for GCRIO shifted to the U.S. Climate Change Science Program.

National Fuel Efficiency Policy. On May 19, 2009, the president announced a new National Fuel Efficiency Policy aimed at increasing fuel economy and reducing GHG pollution. This policy is expected to increase

73 A green job, as defined by the United States Department of Labor, is a job in business that produces goods or provides services that benefit the environment or conserve natural resources.

fuel economy by more than five percent by requiring a fleet-wide average of 35.5 miles per gallon by 2016 starting with model year 2012.

**Fuel Economy Standards.** On September 15, 2009, the U.S. EPA and the NHTSA issued a joint proposal to establish a national program consisting of new standards for model year 2012 through 2016 light-duty vehicles that will reduce GHG emissions and improve fuel economy. The proposed standards were to be phased in and require passenger cars and light-duty trucks to comply with a declining emissions standard. In 2012, passenger cars and light-duty trucks were required to meet an average emissions standard of 295 grams of CO$_2$ per mile and 30.1 miles per gallon. By 2016, the vehicles were required to meet an average standard of 250 grams of CO$_2$ per mile and 35.5 miles per gallon. The final standards were adopted on April 1, 2010.

On December 7, 2009, the U.S. EPA Administrator signed two distinct findings regarding GHGs under Section 202(a) of the CAA (42 United States Code Section 7521):

Endangerment Finding: The Administrator found that the current and projected concentrations of the six key well-mixed GHGs (CO$_2$, CH$_4$, N$_2$O, HFCs, PFCs, and SF$_6$) in the atmosphere threaten the public health and welfare of current and future generations.

Cause or Contribute Finding: The Administrator found that the combined emissions of these well-mixed GHGs from new motor vehicles and new motor vehicle engines contribute to the GHG pollution that threatens public health and welfare.

While these findings do not impose additional requirements on industry or other entities, this action is a prerequisite to finalizing the U.S. EPA’s proposed GHG emissions standards for light-duty vehicles, which were jointly proposed by the U.S. EPA and the NHTSA. On April 1, 2010, the U.S. EPA and the NHTSA issued final rules requiring that by the 2016 model-year, manufacturers must achieve a combined average vehicle emission level of 250 grams CO$_2$ per mile, which is equivalent to 35.5 miles per gallon as measured by U.S. EPA standards.

On November 16, 2011, EPA and NHTSA issued a joint proposal to extend the national program of harmonized GHG and fuel economy standards to model year (MY) 2017 through 2025 passenger vehicles. In August 2012, President Obama finalized standards that will increase fuel economy to the equivalent of 54.5 mpg for cars and light-duty trucks by MY 2025.
On January 12, 2017, the U.S. EPA Administrator Gina McCarthy signed her determination to maintain the GHG emissions standards for model year MY 2022-2025 vehicles. Her final determination found that automakers are well positioned to meet the standards at lower costs than previously estimated.\textsuperscript{75}

On March 15, 2017, the new U.S. EPA Administrator Scott Pruitt and Department of Transportation Secretary Elaine Chao announced that the U.S. EPA intended to reconsider the final determination, issued on January 12, 2017, that recommended no change to the greenhouse gas standards for light duty vehicles for model years 2022-2025.\textsuperscript{76}

On April 2, 2018, the Administrator signed the Mid-term Evaluation Final Determination which finds that the model year 2022-2025 greenhouse gas standards are not appropriate in light of the record before EPA and, therefore, should be revised.\textsuperscript{77}

On September 19, 2019, under the Safer, Affordable, Fuel-Efficient (SAFE) Vehicles Rule, the U.S. Department of Transportation’s National Highway Traffic Safety Administration (NHSTA) and the U.S. EPA issued the final “One National Program Rule.” The rule states that federal law preempts state and local laws regarding tailpipe GHG emissions standards, zero emissions vehicle mandates, and fuel economy for automobiles and light duty trucks. The rule revokes California’s Clean Air Act waiver and preempts California’s Advanced Clean Car Regulations and may potentially impact SCAG’s Connect SoCal and transportation projects in the SCAG region.\textsuperscript{78,79}

On September 20, 2019, a lawsuit was filed by California and a coalition of 22 other states, and the cities of Los Angeles, New York and Washington, D.C., in the United States District Court for the District of Columbia (Case 1:19-cv-02826) challenging the SAFE Rule and arguing that EPA lacks the legal authority to withdraw the California waiver. In April 2021, the U.S. EPA announced it would reconsider its previous

withdrawal and grant California permission to set more stringent climate requirements for cars and SUVs. On March 9, 2022, the U.S. EPA restored California’s 2013 waiver to full force, including both its GHG standards and zero-emissions vehicles sales requirements.

**Executive Order 13693.** Issued on June 10, 2015, Executive Order 13693 — Planning for Federal Sustainability in the Next Decade. The goal of Executive Order 13693 is to maintain federal leadership in sustainability and GHG emission reductions. This Executive Order outlines forward-looking goals for federal agencies in the area of energy, climate change, water use, vehicle fleets, construction, and acquisition. Federal agencies shall, where life-cycle cost-effective, beginning in 2016:

- Reduce agency building energy intensity as measured in British Thermal Units per square foot by 2.5 percent annually through 2025;
- Improve data center energy efficiency at agency buildings;
- Ensure a minimum percentage of total building electric and thermal energy shall be from clean energy sources;
- Improve agency water use efficiency and management (including storm water management); and
- Improve agency fleet and vehicle efficiency and management by achieving minimum percentage GHG emission reductions.

**Executive Order 13783.** Issued on March 28, 2017, Executive Order 13783 — Promoting Energy Independence and Economic Growth — revokes multiple prior Executive Orders and memoranda including Executive Order 13653, the Power Sector Carbon Pollution Standards, Presidential Memorandum — Mitigating Impacts on Natural Resources from Development and Encouraging Related Private Investment, and Presidential Memorandum — Climate Change and National Security, as well as other federal reports and provisions. Executive Order 13783 represents a reversal on federal climate policy relative to the work of previous administrations and its objective is to reduce the regulatory framework applicable to GHG emissions to spur fossil fuel extraction. This Executive Order “established a national policy to promote the clean and safe development of our energy resources while reducing unnecessary regulatory burdens” (Federal Register 2017). The order also “directs the U.S. EPA to review existing regulations, orders, guidance documents and policies that potentially burden the development or use of domestically produced energy resources.” As of April 2020, the Council on Environmental Quality (CEQ) is considering updating its National Environmental Policy (NEPA) implementing regulations and has

---

3.0 Greenhouse Gas

issued a Notice of Proposed Rulemaking that incorporates Executive Order 13783.\textsuperscript{81} How these proposed rule changes will affect GHG emissions cannot be predicted at this time.

**Executive Order 13795.** Issued on April 28, 2017, Executive Order 13795 — Implementing an America-First Offshore Energy Strategy — directs the “policy of the United States to encourage energy exploration and production, including on the Outer Continental Shelf, in order to maintain the Nation’s position as a global energy leader and foster energy security and resilience for the benefit of the American people, while ensuring that any such activity is safe and environmental responsible”.\textsuperscript{82} The objective of the order is to expand the opportunity for offshore energy development by removing restrictions on resource exploration and extraction. This Executive Order prioritizes the development of offshore energy resources over the protection of National Marine Sanctuaries and authorizes the review and potential revision or withdrawal of the Bureau of Ocean Energy Management’s Proposed Rule entitled “Air Quality Control, Reporting, and Compliance,” \textsuperscript{81} Federal Register 19718 and any other related rules and guidance. The implications of implementing Executive Order 13795 with regards to the national GHG emissions inventory cannot be reasonably determined at this time.

**Presidential Executive Order 13990.** President Biden signed Executive Order 13990 – Protecting Public Health and the Environment and Restoring Science to Tackle the Climate Crisis — on January 20, 2021. The order directs all executive departments and agencies to immediately review and, as appropriate and consistent with applicable law, take action to address the promulgation of Federal regulations and other actions during the 2017–2021 executive tenure that conflict with the following national objectives: to improve public health and protect the environment; to ensure access to clean air and water; to limit exposure to dangerous chemicals and pesticides; to hold polluters accountable, including those who disproportionately harm communities of color and low-income communities; to reduce GHG emissions; to bolster resilience to the impacts of climate change; to restore and expand our national treasures and monuments; and to prioritize both environmental justice and the creation of the well-paying union jobs necessary to deliver these goals.\textsuperscript{83}

**Presidential Executive Order 14008.** President Biden signed Executive Order 14008 – Tackling the Climate Crisis At Home and Abroad — on January 27, 2021. The order affirmed the United States as rejoining the

\textsuperscript{81} Council on Environmental Quality, CEQ NEPA Regulations, 2020.

Paris Agreement and expressed its commitment to exercising leadership in promoting global climate ambition to meet the climate challenge.84

State

The state of California has implemented a series of greenhouse gas plans and policies aimed at reducing state greenhouse gas emissions. Measures applicable to the project are summarized below:

California Air Resources Board. The California Air Resources Board (CARB), a part of the California Environmental Protection Agency (CalEPA), is responsible for the coordination and administration of both federal and state air pollution control programs within California. In this capacity, CARB conducts research, sets the California Ambient Air Quality Standards (CAAQS), compiles emission inventories, develops suggested control measures, and provides oversight of local programs. CARB establishes emissions standards for motor vehicles sold in California, consumer products (such as hairspray, aerosol paints, and barbecue lighter fluid), and various types of commercial equipment. It also sets fuel specifications to further reduce vehicular emissions. CARB has primary responsibility for the development of California’s State Implementation Plan (SIP), for which it works closely with the Federal Government and the local air districts. The SIP is required for the State to take over implementation of the Federal Clean Air Act. CARB also has primary responsibility for adopting regulations to meet the State’s goal of reducing GHG emissions. The State has met its goals to reduce GHG emissions to 1990 levels by 2020. Subsequent State goals include reducing GHG emissions to 40 percent below 1990 levels by 2030 and to 80 percent below 1990 levels by 2050.

Executive Order S-3-05. Executive Order S-3-05, issued in June 2005, established GHG emissions targets for the State, as well as a process to ensure the targets are met. The order directed the Secretary for the CalEPA to report every two years on the State’s progress toward meeting the Governor’s GHG emission reduction targets. As a result of this executive order, the California Climate Action Team (CCAT), led by

the Secretary of the CalEPA, was formed. The CCAT is made up of representatives from a number of State agencies and was formed to implement global warming emission reduction programs and reporting on the progress made toward meeting statewide targets established under the Executive Order. The CCAT reported several recommendations and strategies for reducing GHG emissions and reaching the targets established in the Executive Order (CalEPA 2006). The statewide GHG targets are as follows:

- By 2010, reduce to 2000 emission levels;
- By 2020, reduce to 1990 emission levels; and
- By 2050, reduce to 80 percent below 1990 levels.

However, with the adoption of the California Global Warming Solutions Act of 2006 (also known as Assembly Bill [AB] 32), discussed below, the Legislature did not adopt the 2050 horizon-year goal from Executive Order No. S-3-05. In the last legislative session, the Legislature rejected legislation to enact the Executive Order’s 2050 goal.85

The original mandate for the CCAT was to develop proposed measures to meet the emission reduction targets set forth in E.O. S-3-05. The CAT has since expanded and currently has members from 18 state agencies and departments. The CCAT also has ten working groups, which coordinate policies among their members. The working groups and their major areas of focus are:

- Agriculture: Focusing on opportunities for agriculture to reduce GHG emissions through efficiency improvements and alternative energy projects, while adapting agricultural systems to climate change;
- Biodiversity: Designing policies to protect species and natural habitats from the effects of climate change;
- Energy: Reducing GHG emissions through extensive energy efficiency policies and renewable energy generation;
- Forestry: Coupling GHG mitigation efforts with climate change adaptation related to forest preservation and resilience, waste to energy programs and forest offset protocols;

---

85 The original version of SB 32 as introduced in the Legislature contained a commitment to the 2050 goal, but this commitment was not included in the final version of the bill. See: https://leginfo.legislature.ca.gov/faces/billVersionsCompareClient.xhtml?bill_id=201520160SB32&cversion=20150SB32991NT. In addition, the Supreme Court recently held in Cleveland National Forest Foundation et al. v San Diego Association of Governments (SANDAG)(S223603, July 13, 2017) that SANDAG did not abuse its discretion in declining to adopt the 2050 goal as a measure of significance in an analysis of the consistency of projected 2050 GHG emissions with the goals in Executive Order S-3-05.
Land Use and Infrastructure: Linking land use and infrastructure planning to efforts to reduce GHG from vehicles and adaptation to changing climatic conditions;

Oceans and Coastal: Evaluating the effects of sea level rise and changes in coastal storm patterns on human and natural systems in California;

Public Health: Evaluating the effects of GHG mitigation policies on public health and adapting public health systems to cope with changing climatic conditions;

Research: Coordinating research concerning impacts of and responses to climate change in California;

State Government: Evaluating and implementing strategies to reduce GHG emissions resulting from state government operations; and

Water: Reducing GHG impacts associated with the state’s water.

The CCAT stated that smart land use is an umbrella term for strategies that integrate transportation and land-use decisions. Such strategies generally encourage jobs/housing proximity, transit-oriented development, and high-density residential/commercial development along transit corridors. These strategies develop more efficient land-use patterns within each jurisdiction or region to match population growth and workforce and socioeconomic needs for the full spectrum of the population. “Intelligent transportation systems” involve the application of advanced technology systems and management strategies to improve operational efficiency of transportation systems and the movement of people, goods, and service.86

Assembly Bill 32. The California Global Warming Solutions Act of 2006 (AB 32) was signed into law in September 2006 after considerable study and expert testimony before the Legislature. The law instructs CARB to develop and enforce regulations for the reporting and verifying of statewide GHG emissions. AB 32 directed CARB to set a GHG emission limit based on 1990 levels, to be achieved by 2020. AB 32 set a timeline for adopting a scoping plan for achieving GHG reductions in a technologically and economically feasible manner.87

The heart of AB 32 is the requirement to reduce statewide GHG emissions to 1990 levels by 2020. AB 32 required CARB to adopt rules and regulations in an open public process to achieve the maximum

86 California Environmental Protection Agency, Climate Action Team Report to Governor Schwarzenegger and the Legislature, 2006.
technologically feasible and cost-effective GHG reductions. CARB accomplished the key milestones set forth in AB 32, including the following:

- June 30, 2007. Identification of discrete early action GHG emissions reduction measures. On June 21, 2007, CARB satisfied this requirement by approving three early action measures.\(^8\) These were later supplemented by adding six other discrete early action measures.\(^9\)

- January 1, 2008. Identification of the 1990 baseline GHG emissions level and approval of a statewide limit equivalent to that level and adoption of reporting and verification requirements concerning GHG emissions. On December 6, 2007, CARB approved a statewide limit on GHG emissions levels for the year 2020 consistent with the determined 1990 baseline.\(^10\)

- January 1, 2010. Adoption and enforcement of regulations to implement the “discrete” actions. Several early action measures have been adopted and became effective on January 1, 2010.\(^12,13\)

- January 1, 2011. Adoption of GHG emissions limits and reduction measures by regulation. On October 28, 2010, CARB released its proposed cap-and-trade regulations, which would cover sources of approximately 85 percent of California’s GHG emissions.\(^14\) CARB’s Board ordered its Executive Director to prepare a final regulatory package for cap-and-trade on December 16, 2010.\(^15\)

As noted above, CARB adopted the Scoping Plan in 2008 to achieve the goals of AB 32. The Scoping Plan establishes an overall framework for the measures that will be adopted to reduce California’s GHG emissions for various categories of emissions. CARB determined that achieving the 1990 emission level by

---

2020 would require an approximately 28.5 percent reduction of GHG emissions in the absence of new laws and regulations (referred to as “business as usual” or “No Action Taken”). The Scoping Plan evaluates opportunities for sector-specific reductions, integrates all CARB and Climate Action Team early actions and additional GHG reduction measures by both entities, and identifies additional measures to be pursued as regulations, and outlines the role of a cap-and-trade program. Key elements of the Scoping Plan include the following:

- Expanding and strengthening existing energy efficiency programs as well as building and appliance standards;

- Achieving a statewide renewable energy mix of 33 percent;

- Developing a California cap-and-trade program that links with other Western Climate Initiative partner programs to create a regional market system and caps sources contributing 85 percent of California’s GHG emissions;

- Establishing targets for transportation-related GHG emissions for regions throughout California, and pursuing policies and incentives to achieve those targets;

- Adopting and implementing measures pursuant to existing state laws and policies, such as California’s clean car standards, goods movement measures, and the Low Carbon Fuel Standard; and

- Creating targeted fees, including a public goods charge on water use, fees on high global warming potential gases, and a fee to fund the administrative costs of the State of California’s long-term commitment to AB 32 implementation.

In connection with the preparation of the environmental impact analyses (referred to as the Functional Equivalent Document [FED] and the Supplement to the FED) to support AB 32 Scoping Plan, CARB released revised estimates of the expected 2020 emission reductions in consideration of the economic recession and the availability of updated information from development of measure specific regulations. Incorporation of revised estimates in consideration of the economic recession reduced the projected 2020 emissions from 596 metric tons of CO2 equivalent (MTCO2e) to 545 million MTCO2e (MMTCO2e) (CARB 2011c). Under this scenario, achieving the 1990 emissions level in 2020 would require a reduction of GHG emissions of 118 MMTCO2e, or 21.7 percent. This revised reduction represents a 6.8 percentage point reduction from the 28.5 percent level determined in CARB’s 2008 Scoping Plan. The 2020 AB 32 baseline was also updated to account for measures incorporated into the inventory, including Pavley (vehicle

---

96 CARB, Climate Change Scoping Plan, 2008.
model-years 2009 to 2016) and the renewable portfolio standard (12 percent to 20 percent). Inclusion of these measures further reduced the 2020 baseline to 507 MMTCO2e.

**Executive Order B-30-15.** On April 29, 2015, Governor Brown issued Executive Order B-30-15. Therein, the Governor directed the following:

- Established a new interim statewide reduction target to reduce GHG emissions to 40 percent below 1990 levels by 2030.
- Ordered all state agencies with jurisdiction over sources of GHG emissions to implement measures to achieve reductions of GHG emissions to meet the 2030 and 2050 reduction targets.
- Directed CARB to update the Climate Change Scoping Plan to express the 2030 target in terms of million metric tons of carbon dioxide equivalent.

**Senate Bill 32.** In 2016, the Legislature passed Senate Bill (SB) 32 with the companion bill AB 197, which further requires California to reduce GHG emissions to 40 percent below 1990 levels by 2030. The bill targets reductions from the leading GHG emitters in the State. Transportation is the largest sector of GHG emissions in California and will be a primary subject for reductions. Through advances in technology and improved public transportation, the State plans to reduce GHG emissions from transportation sources to assist in meeting the 2030 reduction goal. AB 197, signed September 8, 2016, is a bill linked to SB 32 and signed on September 8, 2016, prioritizes efforts to cut GHG emissions in low-income or minority communities. AB 197 requires CARB to make available, and update at least annually, on its website the emissions of GHGs, criteria pollutants, and toxic air contaminants for each facility that reports to CARB and air districts. In addition, AB 197 adds two Members of the Legislature to the CARB board as ex officio, non-voting members and creates the Joint Legislative Committee on Climate Change Policies to ascertain facts and make recommendations to the Legislature and the houses of the Legislature concerning the State’s programs, policies, and investments related to climate change.

**2017 Scoping Plan.** In response to the passage of SB 32 and the identification of the 2030 GHG reduction target, CARB adopted the 2017 Climate Change Scoping Plan in December 2017.97 The 2017 Update builds upon the framework established by the 2008 Climate Change Scoping Plan and the First Update while identifying new, technologically feasible, and cost-effective strategies to ensure that California meets its GHG reduction targets in a way that promotes and rewards innovation, continues to foster economic growth, and delivers improvements to the environment and public health. The 2017 Update includes policies to require direct GHG reductions at some of the State’s largest stationary sources and mobile

---

97 CARB, California’s 2017 Climate Change Scoping Plan, November 2017.
sources. These policies include the use of lower GHG fuels, efficiency regulations, and the Cap-and-Trade program, which constraints and reduces emissions at covered sources.\(^98\)

CARB’s projected Statewide 2030 emissions takes into account 2020 GHG reduction policies and programs.\(^99\) The 2017 Scoping Plan also addresses GHG emissions from natural and working lands of California, including the agriculture and forestry sectors. Under the Scoping Plan Scenario, the majority of the reductions would result from the continuation of the Cap-and-Trade regulation. Additional reductions would be achieved from electricity sector standards (i.e., utility providers to supply 50 percent renewable electricity by 2030), doubling the energy efficiency savings at end uses, additional reductions from the LCFS, implementing the short-lived GHG strategy (e.g., hydrofluorocarbons), and implementing the mobile source strategy and sustainable freight action plan. Implementation of mobile source strategies (cleaner technology and fuels) include the following:

- At least 1.5 million zero emission and plug-in hybrid light-duty electric vehicles by 2025
- At least 4.2 million zero emission and plug-in hybrid light-duty electric vehicles by 2030
- Further increase GHG stringency on all light-duty vehicles beyond existing Advanced
- Clean Cars regulations
- Medium- and heavy-duty GHG Phase 2
- Innovative Clean Transit: Transition to a suite of to-be-determined innovative clean transit options. Assumed 20 percent of new urban buses purchased beginning in 2018 will be zero emission buses with the penetration of zero-emission technology ramped up to 100 percent of new sales in 2030. Also, new natural gas buses, starting in 2018, and diesel buses, starting in 2020, meet the optional heavy-duty low-NOX standard.
- Last Mile Delivery: New regulation that would result in the use of low NOX or cleaner engines and the deployment of increasing numbers of zero-emission trucks primarily for Class 3–7 last mile delivery trucks in California. This measure assumes ZEVs comprise 2.5 percent of new Class 3–7 truck sales in local fleets starting in 2020, increasing to 10 percent in 2025 and remaining flat through 2030.
- Further reduce VMT through continued implementation of SB 375 and regional Sustainable Communities Strategies; forthcoming statewide implementation of SB 743; and potential additional

\(^98\) CARB, California’s 2017 Climate Change Scoping Plan, November 2017.

\(^99\) CARB, California’s 2017 Climate Change Scoping Plan, November 2017.
VMT reduction strategies not specified in the Mobile Source Strategy but included in the document “Potential VMT Reduction Strategies for Discussion.”

The alternatives in the Scoping Plan are designed to consider various combinations of these programs, as well as consideration of a carbon tax in the event the Cap-and-Trade regulation is not continued. However, in July 2017, the California Legislature voted to extend the Cap-and-Trade regulation to 2030.

The 2017 Scoping Plan discusses the role of local governments in meeting the State’s GHG reductions goals because local governments have jurisdiction and land use authority related to: community-scale planning and permitting processes, local codes and actions, outreach and education programs, and municipal operations.100 Furthermore, local governments may have the ability to incentivize renewable energy, energy efficiency, and water efficiency measures.101

For individual projects under CEQA, the 2017 Scoping Plan states that local governments can support climate action when considering discretionary approvals and entitlements. According to the 2017 Scoping Plan, lead agencies have the discretion to develop evidence-based numeric thresholds consistent with the Scoping Plan, the State’s long-term goals, and climate change science (CARB 2017).

The City of Los Angeles has not developed per capita targets for 2030 or 2050; however, the City recognizes that GHG emissions reductions are necessary in the public and private sectors. The City has taken the initiative in combating climate change by developing programs such as the Green New Deal and Green Building Code. Each of these programs is discussed further below.

A summary of the required estimated GHG emissions reductions is provided in Table 14.

100 CARB, California’s 2017 Climate Change Scoping Plan, November 2017.
101 CARB, California’s 2017 Climate Change Scoping Plan, November 2017.

</table>

<sup>1</sup> 596 – 427 = 169 / 596 = 28.4%

<sup>2</sup> 509.4 – 431 = 78.4 / 509.4 = 15.4%

<sup>3</sup> 389 – 260 = 129 / 389 = 33.2%

Under the Scoping Plan Scenario, continuation of the Cap-and-Trade regulation (or carbon tax) is expected to cover approximately 34 to 79 MMTCO₂ of the 2030 reduction obligation.<sup>32</sup> The State’s short-lived climate pollutants strategy, which is for GHGs that remain in the atmosphere for shorter periods of time compared to longer-lived GHGs like CO₂, is expected to cover approximately 17 to 35 MMTCO₂. The Renewables Portfolio Standard with 50 percent renewable electricity by 2030 is expected to cover approximately 3 MMTCO₂. The mobile source strategy and sustainable freight action plan includes maintaining the existing vehicle GHG emissions standards, increasing the number of zero emission vehicles and improving the freight system efficiency, and is expected to cover approximately 11 to 13 MMTCO₂. Under the Scoping Plan Scenario, CARB expects that the reduction in GHGs from doubling of the energy efficiency savings in natural gas and electricity end uses in the CEC 2015 Integrated Energy Policy Report by 2030 would cover approximately 7 to 9 MMTCO₂ of the 2030 reduction obligation. The other strategies would be expected to cover the remaining 2030 reduction obligations.

**Draft 2022 Scoping Plan.** CARB released the Draft 2022 Scoping Plan Update in May 2022.<sup>102</sup> The Draft 2022 Scoping Plan Update identifies a technologically feasible, cost-effective and equity-focused path to

---

<sup>102</sup> CARB, Draft 2022 Scoping Plan Update, May 2022.
achieve carbon neutrality by 2045, or earlier, while also assessing the progress the State is making toward reducing its GHG emissions by at least 40 percent below 1990 levels by 2030, as called for in SB 32 and laid out in the 2017 Scoping Plan. The Draft 2022 Update builds upon current and previous environmental justice efforts to integrate environmental justice directly into the plan to ensure that no community is left behind. Specifically, the Draft 2022 Update:

- Identifies a path to keep California on track to meet its SB 32 GHG reduction target of at least 40 percent below 1990 emissions by 2030;
- Identifies a technologically feasible, cost-effective path to achieve carbon neutrality by 2045 or earlier;
- Focuses on strategies for reducing California’s dependency on petroleum to provide consumers with clean energy options that address climate change, improve air quality, and support economic growth and clean sector jobs;
- Integrates equity and protecting California’s most impacted communities as a driving principle;
- Incorporates the contribution of natural and working lands to the state’s GHG emissions inventory, as well as its role in achieving carbon neutrality;
- Relies on the contemporary science, including the need to deploy all viable tools to address the existential threat that climate change poses, including carbon capture and sequestration as well as direct air capture.
- Evaluates multiple options for achieving GHG and carbon neutrality targets, as well as the public health benefits and economic impacts associated with each.

The Draft 2022 Update evaluated four scenarios to reach carbon neutrality and the most viable path to achieve the State’s 2030 interim GHG reduction and 2035/2045 GHG neutrality targets. Ultimately, CARB staff selected Scenario 3 as the “Proposed Scenario,” which achieves carbon neutrality by 2045 by deploying a broad portfolio of existing and emerging fossil fuel alternatives and clean technologies. Among the proposed actions by sector are the following:

- VMT per capita to be reduced 12% below 2019 levels by 2030 and 22% below 2019 levels by 2045.
- 100% of light duty vehicle (LDV) sales to be zero emission (ZEV) by 2035.
- New buildings, all electric appliances beginning in 2026 (residential) and 2029 (commercial).
- Existing residential buildings 80% of appliance sales are electric by 2030 and 100% by 2035.
• Existing commercial buildings 80% of appliance sales are electric by 2030 and 100% by 2045.

• Construction equipment 25% energy demand electrified by 2030 and 75% by 2045.

Executive Order B-55-18. On September 10, 2018, the governor issued Executive Order B-55-18, which established a new statewide goal of achieving carbon neutrality by 2045 and maintaining net negative emissions thereafter. This goal is in addition to the existing statewide GHG reduction targets established by SB 375, SB 32, SB 1383, and SB 100.

Cap-and-Trade Program. As mentioned above, the Scoping Plan identifies a cap-and-trade program as one of the strategies the State will employ to reduce GHG emissions that cause climate change. The cap-and-trade program is implemented by CARB and “caps” GHG emissions from the industrial, utility, and transportation fuels sections, which account for roughly 85 percent of the State’s GHG emissions. The program works by establishing a hard cap on about 85 percent of total statewide GHG emissions. The cap starts at expected business-as-usual emissions levels in 2012 and declines two to three percent per year. Originally with a planning horizon of 2020, the recent approval of AB 398 in July 2017 extended the program until 2030. Fewer GHG emissions allowances are available each year, requiring covered sources to reduce their emissions or pay increasingly higher prices for those allowances. The cap level is set in 2030 to ensure California complies with SB 32’s emission reduction target of 40 percent below 1990 GHG emission levels.

The scope of GHG emission sources subject to cap-and-trade in the first compliance period (2013-2014) includes all electricity generated and imported into California (the first deliverer of electricity into the State is the “capped” entity and the one that will have to purchase allowances as appropriate), and large industrial facilities emitting more than 25,000 MTCO2e per year (e.g., oil refineries and cement manufacturers). The scope of GHG emission sources subjected to cap-and-trade during the second compliance period (2015 onward) expands to include distributors of transportation fuels (including gasoline and diesel), natural gas, and other fuels. The regulated entity will be the fuel provider that distributes the fuel upstream (not the gas station). In total, the cap-and-trade program is expected to include roughly 350 large businesses, representing about 600 facilities. Individuals and small businesses will not be regulated.

Under the program, companies do not have individual or facility-specific reduction requirements. Rather, all companies covered by the regulation are required to turn in allowances103 in an amount equal to their total GHG emissions during each phase of the program. The program gives companies the flexibility to either trade allowances with others or take steps to cost-effectively reduce emissions at their own facilities. Companies that emit more will have to turn in more allowances, and companies that can cut their emissions

---

103 “Allowance” means a limited tradable authorization to emit up to one metric ton of carbon dioxide equivalent.
3.0 Greenhouse Gas

will have to turn in fewer allowances. Furthermore, as the cap declines, total GHG emissions are reduced. On October 20, 2011, CARB’s Board adopted the final cap-and-trade regulation. The cap-and-trade program began on January 1, 2012, with an enforceable compliance obligation beginning with the 2013 GHG emissions. In July 2017, the Legislature passed legislation to extend the cap-and-trade program to 2030.

**Senate Bill 350.** Adopted on October 7, 2015, SB 350 supports the reduction of GHG emissions from the electricity sector through a number of measures, including requiring electricity providers to achieve a 50 percent renewables portfolio standard by 2030, a cumulative doubling of statewide energy efficiency savings in electricity and natural gas by retail customers by 2030.

**Senate Bill 1383.** Approved by the governor in September 2016, SB 1383 requires the CARB to approve and begin implementing a comprehensive strategy to reduce emissions of short-lived climate pollutants. The bill requires the strategy to achieve the following reduction targets by 2030:

- Methane – 40 percent below 2013 levels
- Hydrofluorocarbons – 40 percent below 2013 levels
- Anthropogenic black carbon – 50 percent below 2013 levels

The bill also requires California Department of Resources Recycling and Recovery (CalRecycle), in consultation with the State board, to adopt regulations that achieve specified targets for reducing organic waste in landfills.

**Senate Bill 97.** Per SB 97, which was signed into law in 2007, the California Natural Resources Agency adopted amendments to the *State CEQA Guidelines*, which address the specific obligations of public agencies when analyzing GHG emissions under CEQA to determine a project’s effects on the environment (codified as Public Resources Code [PRC] 21083.05). Specifically, PRC 21083.05 states, “[t]he Office of Planning and Research and the Natural Resources Agency shall periodically update the guidelines for the mitigation of greenhouse gas emissions or the effects of greenhouse gas emissions.”

**Sustainable Communities and Climate Protection Act (Senate Bill 375).** The Sustainable Communities and Climate Protection Act of 2008, or SB 375 (Chapter 728, Statutes of 2008), establishes mechanisms for the development of regional targets for reducing passenger vehicle GHG emissions, was adopted by the

---

3.0 Greenhouse Gas

State on September 30, 2008. SB 375 finds that the “transportation sector is the single largest contributor of greenhouse gases of any sector.” Under SB 375, CARB is required, in consultation with the Metropolitan Planning Organizations, to set regional GHG reduction targets for the passenger vehicle and light-duty truck sector for 2020 and 2035. SCAG is the Metropolitan Planning Organization in which the City of Los Angeles is located in. CARB set targets for 2020 and 2035 for each of the 18 metropolitan planning organization regions in 2010, and updated them in 2018. In March 2018, the CARB updated the SB 375 targets for the SCAG region to require an 8 percent reduction by 2020 and a 19 percent reduction by 2035 in per capita passenger vehicle GHG emissions. As discussed further below, SCAG has adopted an updated Regional Transportation Plan / Sustainable Community Strategies (RTP/SCS) subsequent to the update of the emission targets. The 2020–2045 RTP/SCS is expected to reduce per capita transportation emissions by 19 percent by 2035, which is consistent with SB 375 compliance with respect to meeting the State’s GHG emission reduction goals.

Under SB 375, the target must be incorporated within that region’s Regional Transportation Plan (RTP), which is used for long-term transportation planning, in a Sustainable Communities Strategy (SCS). Certain transportation planning and programming activities would then need to be consistent with the SCS; however, SB 375 expressly provides that the SCS does not regulate the use of land, and further provides that local land use plans and policies (e.g., general plans) are not required to be consistent with either the RTP or SCS.

**Emission Performance Standards.** SB 1368, signed September 29, 2006, is a companion bill to AB 32, which requires the CPUC and the CEC to establish GHG emission performance standards for the generation of electricity. These standards also generally apply to power that is generated outside of California and imported into the State. SB 1368 provides a mechanism for reducing the emissions of electricity providers, thereby assisting CARB to meet its mandate under AB 32.

**Renewable Portfolio Standards (SB 1078, SB 107, SB X 1-2, and SB 100).** Established in 2002 under SB 1078, and accelerated in 2006 under SB 107, in 2011 under SB X 1-2, and again in 2018 under SB 100, California’s Renewable Portfolio Standards (RPS) require retail sellers of electric services to increase procurement from eligible renewable energy resources to 33 percent of total retail sales by 2020, 44 percent

---

by 2024, 52 percent by 2027, and 60 percent in 2030. Additionally, the State has made a commitment that renewable energy resources and zero-carbon resources supply 100 percent of all retail sales of electricity by 2045. Initially, the RPS provisions applied to investor-owned utilities, community choice aggregators, and electric service providers. SB X 1-2 added, for the first time, publicly-owned utilities to the entities subject to RPS.

**Assembly Bill 1493.** Mobile Source Reductions Assembly Bill 1493, the “Pavley Standard,” required CARB to adopt regulations by January 1, 2005, to reduce GHG emissions from non-commercial passenger vehicles and light-duty trucks of model year 2009 through 2016. The bill also required the California Climate Action Registry to develop and adopt protocols for the reporting and certification of GHG emissions reductions from mobile sources for use by CARB in granting emission reduction credits. The bill authorizes CARB to grant emission reduction credits for reductions of GHG emissions prior to the date of enforcement of regulations, using model year 2000 as the baseline for reduction. In 2004, CARB applied to the U.S. EPA for a waiver under the federal Clean Air Act to authorize implementation of these regulations. On June 30, 2009, the U.S. EPA granted the waiver with the following provision: CARB may not hold a manufacturer liable or responsible for any noncompliance caused by emission debits generated by a manufacturer for the 2009 model year. CARB has adopted a new approach to passenger vehicles (cars and light trucks), by combining the control of smog-causing pollutants and GHG emissions into a single coordinated package of standards. The new approach also includes efforts to support and accelerate the numbers of plug-in hybrids and zero-emission vehicles in California.

**Low Carbon Fuel Standard (Executive Order S-01-07).** Executive Order S-01-07 (January 18, 2007) requires a 10 percent or greater reduction in the average fuel carbon intensity for transportation fuels in California regulated by CARB. CARB identified the Low Carbon Fuel Standard (LCFS) as a Discrete Early Action item under AB 32, and the final resolution (09-31) was issued on April 23, 2009. In 2009, CARB approved for adoption the LCFS regulation, which became fully effective in April 2010 and is codified at Title 17, California Code of Regulations (CCR), Sections 95480-95490. The LCFS reduced GHG emissions by reducing the carbon intensity of transportation fuels used in California by 10 percent between 2011 and 2020. In 2018, CARB approved amendments to LCFS regulations, which included strengthening and smoothing the carbon intensity benchmarks through 2030 in-line with California’s 2030 GHG emission reduction target enacted through SB 32, adding new crediting opportunities to promote zero emission

---

vehicle adoption, alternative jet fuel, carbon capture and sequestration, and advanced technologies to achieve deep decarbonization in the transportation sector.

**Advanced Clean Cars Program.** In 2012, CARB approved the Advanced Clean Cars Program, a new emissions-control program for model year 2017 through 2025. The program combines the control of smog, soot, and GHGs with requirements for greater numbers of zero-emission vehicles. By 2025, when the rules will be fully implemented, the new automobiles will emit 34 percent fewer global warming gases and 75 percent fewer smog-forming emissions.

**Senate Bill 743 (SB 743).** SB 743, adopted September 27, 2013, encourages land use and transportation planning decisions and investments that reduce vehicle miles traveled (VMT), which contribute to GHG emissions, as required by AB 32. Key provisions of SB 743 include reforming aesthetics and parking CEQA analysis for certain urban infill projects and eliminating the measurement of auto delay, including Level of Service (LOS), as a metric that can be used for measuring traffic impacts in transit priority areas. SB 743 requires the Governor’s Office of Planning and Research (OPR) to develop revisions to the CEQA Guidelines establishing criteria for determining the significance of transportation impacts of projects within transit priority areas that promote the “…reduction of GHG emissions, the development of multimodal transportation networks, and a diversity of land uses.” It also allows OPR to develop alternative metrics outside of transit priority areas. In December 2018, the Natural Resources Agency updated the CEQA Guidelines and provided guidance for implementing SB 743.

**California Integrated Waste Management Act (AB 341).** The California Integrated Waste Management Act of 1989, as modified by AB 341, requires each jurisdiction’s source reduction and recycling element to include an implementation schedule that shows: diversion of 25 percent of all solid waste by January 1, 1995, through source reduction, recycling, and composting activities; diversion of 50 percent of all solid waste on and after January 1, 2000; and diversion of 75 percent of all solid waste by 2020, and annually thereafter.

**California Appliance Efficiency Regulations.** The Appliance Efficiency Regulations (Title 20, Sections 1601 through 1608), adopted by the CEC, include standards for new appliances (e.g., refrigerators) and lighting, if they are sold or offered for sale in California. These standards include minimum levels of operating efficiency, and other cost-effective measures, to promote the use of energy- and water-efficient appliances.

**California Green Building Code (California Code of Regulations Title 24).** Although not originally aimed at reducing GHG emissions, CCR Title 24 Part 6: California’s Energy Efficiency Standards for Residential and Nonresidential Buildings (Title 24), was first adopted in 1978 in response to a legislative mandate to reduce
California’s energy consumption. Since then, Title 24 has been amended to recognize that energy-efficient buildings require less electricity and reduce fuel consumption, which subsequently reduces GHG emissions. The current 2019 Title 24 standards were adopted, among other reasons, to respond to the requirements of AB 32. Specifically, new development projects constructed within California after January 1, 2019 are subject to the mandatory planning and design, energy efficiency, water efficiency and conservation, material conservation and resources efficiency, and environmental quality measures of the California Green Building Standards (CalGreen) Code (CCR Title 24, Part 11). Title 24 standards are updated triennially; the next update is scheduled to be adopted in 2022 and will take effect on January 1, 2023.

**CEQA Guidelines.** In August 2007, the California State Legislature adopted Senate Bill 97 (SB 97) (Chapter 185, Statutes of 2007), requiring the Governor’s Office of Planning and Research (OPR) to prepare and transmit new CEQA Guidelines for the mitigation of GHG emissions or the effects of GHG emissions to the Resources Agency by July 1, 2009. In response to SB 97, the OPR adopted CEQA Guidelines that became effective on March 18, 2010.

However, neither a threshold of significance nor any specific mitigation measures are included or provided in the guidelines. The guidelines require a lead agency to make a good-faith effort, based on the extent possible on scientific and factual data, to describe, calculate, or estimate the amount of GHG emissions resulting from a project. Discretion is given to the lead agency whether to: (1) use a model or methodology to quantify GHG emissions resulting from a project, and which model or methodology to use; or (2) rely on a qualitative analysis or performance-based standards. Furthermore, three factors are identified that should be considered in the evaluation of the significance of GHG emissions:

1. The extent to which a project may increase or reduce GHG emissions as compared to the existing environmental setting;

2. Whether the project emissions exceed a threshold of significance that the lead agency determines applies to the project; and

3. The extent to which the project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of GHG emissions.

---

115 See 14 Cal. Code Regs. §§ 15064.7 (generally giving discretion to lead agencies to develop and publish thresholds of significance for use in the determination of the significance of environmental effects), 15064.4 (giving discretion to lead agencies to determine the significance of impacts from GHGs).

The administrative record for the Guidelines Amendments also clarifies “that the effects of greenhouse gas emissions are cumulative and should be analyzed in the context of California Environmental Quality Act’s requirements for cumulative impact analysis.”

**Senate Bill 1 (SB 1) and Senate Bill 1017 (SB 1017) (Million Solar Roofs).** SB 1 and SB 1017, enacted in August 2006, set a goal to install 3,000 megawatts of new solar capacity by 2017 – with a stated intent to move the state toward a cleaner energy future and help lower the cost of solar systems for consumers. The Million Solar Roofs Program is a ratepayer-financed incentive program aimed at transforming the market for rooftop solar systems by driving down costs over time. It provides up to $3.3 billion in financial incentives that decline over time.

**GHG Emissions Standards for Baseload Generation.** SB 1368, which was signed into law on September 29, 2006, prohibits any retail seller of electricity in California from entering into a long-term financial commitment for baseload generation if the GHG emissions are higher than those from a combined-cycle natural gas power plant. This performance standard (i.e., reducing long-term GHG emissions as a result of electrical baseload generation) applies to electricity generated both within and outside of California, and to publicly owned, as well as investor-owned, electric utilities.

**Senate Bill 350 (SB 350).** Adopted on October 7, 2015, SB 350 supports the reduction of GHG emissions from the electricity sector through a number of measures, including requiring electricity providers to achieve a 50 percent renewable portfolio standard by 2030, a cumulative doubling of statewide energy efficiency savings in electricity and natural gas by retail customers by 2030.

**California Green Building Standards Code (CalGreen Code) (California Code of Regulations [CCR], Title 24).** Although not originally aimed at reducing GHG emissions, CCR Title 24 Part 6: California’s Energy Efficiency Standards for Residential and Nonresidential Buildings (Title 24), was first adopted in 1978 in response to a legislative mandate to reduce California’s energy consumption. Since then, Title 24 has been amended to recognize that energy-efficient buildings require less electricity and reduce fuel consumption, which subsequently decreases GHG emissions. The current 2016 Title 24 standards were adopted, among other reasons, to respond to the requirements of AB 32. The goals of the Title 24 standards include achieving a 20 percent reduction of indoor water use and a 50 percent reduction of construction waste. Specifically, new development projects constructed within California after January 1, 2017, are subject to the mandatory planning and design, energy efficiency, water efficiency and conservation, material conservation and resources efficiency, and environmental quality measures of the CalGreen Code.

---

117 Letter from Cynthia Bryant, Director of the Governor’s Office of Planning and Research to Mike Chrisman, California Secretary for Natural Resources, dated April 13, 2009.
(CCR, Title 24, Part 11). The outdoor water use standards of the CalGreen Code, which requires a 20 percent reduction in indoor water use, are already addressed by the City’s Water Conservation Ordinance.

**Regional**

**SCAG Regional Transportation Plan/Sustainable Communities Strategy.** To implement SB 375 and reduce GHG emissions by correlating land use and transportation planning, SCAG adopted the 2020–2045 Regional Transportation Plan/Sustainable Communities Strategy (2020–2045 RTP/SCS) in October 2020. The vision for the region incorporates a range of best practices for increasing transportation choices, reducing dependence on personal automobiles, further improving air quality, and encouraging growth in walkable, mixed-use communities with ready access to transit infrastructure and employment. More and varied housing types and employment opportunities would be located in and near job centers, transit stations and walkable neighborhoods where goods and services are easily accessible via shorter trips. To support shorter trips, people would have the choice of using neighborhood bike networks, car share or micro-mobility services like shared bicycles or scooters. For longer commutes, people would have expanded regional transit services and more employer incentives to carpool or vanpool. Other longer trips would be supported by on-demand services such as micro transit, carshare, and citywide partnerships with ride hailing services. For those that choose to drive, hotspots of congestion would be less difficult to navigate due to cordon pricing and using an electric vehicle will be easier thanks to an expanded regional charging network.

The 2020–2045 RTP/SCS states that the SCAG region was home to about 18.8 million people in 2016 and currently includes approximately 6.0 million homes and 8.4 million jobs. By 2045, the integrated growth forecast projects that these figures will increase by 3.7 million people, with nearly 1.6 million more homes and 1.6 million more jobs. Transit Priority Areas (TPAs) will account for less than 1 percent of regional total land but are projected to accommodate 30 percent of future household growth between 2016 and 2045. The 2020–2045 RTP/SCS overall land use pattern reinforces the trend of focusing new housing and employment in the region’s TPAs. TPAs are a cornerstone of land use planning best practice in the SCAG region because they concentrate roadway repair investments, leverage transit and active transportation investments, reduce regional life cycle infrastructure costs, improve accessibility, create local jobs, and have the potential to improve public health and housing affordability.

---

119 Defined by the 2020–2045 RTP/SCS as generally walkable transit villages or corridors that are within 0.5 mile of a major transit stop (rail or bus rapid transit station) with 15-minute or less service frequency during peak commute hours.
The 2020–2045 RTP/SCS is expected to reduce per capita transportation emissions by 19 percent by 2035, which is consistent with SB 375 compliance with respect to meeting the State’s GHG emission reduction goals. Due to fuel economy and efficiency improvements, GHG emission rates of model year 2017 vehicles have decreased by 15 to 20 percent when compared to model year 2008 and earlier vehicles. However, for purposes of SB 375 emissions reduction targets, the fuel economy improvements have been largely excluded from the reduction calculation. The SB 375 target focuses on the amount of vehicle travel per capita. As discussed above, OPR recommended that achieving 15 percent lower per capita (residential) or per employee (office) VMT than existing development is both generally achievable and is supported by evidence that connects this level of reduction to the State’s emissions goals (i.e., SB 375 goal). The reductions generated by fuel economy improvements are already included as part of the State’s GHG emissions reduction program and are not double counted in the SB 375 target calculation.

**South Coast Air Quality Management District CEQA Guidance.** The City of Los Angeles is located in the South Coast Air Basin (Air Basin), which consists of Orange County, Los Angeles County (excluding the Antelope Valley portion), and the western, non-desert portions of San Bernardino and Riverside Counties, in addition to the San Gorgonio Pass area in Riverside County. The South Coast Air Quality Management District (SCAQMD) is responsible for air quality planning in the Air Basin and developing rules and regulations to bring the area into attainment of the ambient air quality standards. This is accomplished through air quality monitoring, evaluation, education, implementation of control measures to reduce emissions from stationary sources, permitting and inspection of pollution sources, enforcement of air quality regulations, and by supporting and implementing measures to reduce emissions from motor vehicles.

In 2008, SCAQMD released draft guidance regarding interim CEQA GHG significance thresholds. A GHG Significance Threshold Working Group was formed to further evaluate potential GHG significance thresholds. The SCAQMD proposed the use of a percent emission reduction target to determine significance for commercial/residential projects that emit greater than 3,000 MTCO₂e per year. Under this proposal, commercial/residential projects that emit fewer than 3,000 MTCO₂e per year would be assumed to have a less than significant impact on climate change. On December 5, 2008, the SCAQMD Governing Board adopted the staff proposal for an interim GHG significance threshold of 10,000 MTCO₂e per year for stationary source/industrial projects where the SCAQMD is the lead agency. However, the SCAQMD has yet to adopt a GHG significance threshold for land use development projects (e.g., residential/commercial

---

projects). The Working Group has been inactive since 2011, and SCAQMD has not formally adopted any GHG significance threshold for other jurisdictions.

Local

**Sustainable City pLAN (pLAN).** In addition to GreenLA, Mayor Eric Garcetti released Los Angeles’s first-ever Sustainable City pLAN on April 8, 2015. The Sustainable City pLAN is a roadmap to achieving short-term results and sets a path to strengthen and transform the City in future decades. Actionable goals include increasing the green building standard for new construction, creating a benchmarking policy for building energy use, developing “blue, green, and black” waste bin infrastructure, reducing water use by 20 percent, and possibly requiring LEED Silver or better certification for new construction. In 2019, the Sustainable City pLAN was updated with new goals, targets, and actions through adoption of L.A.’s Green New Deal as discussed in greater detail below.

**Los Angeles Green New Deal.** The City of Los Angeles addressed the issue of global climate change in Green LA, An Action Plan to Lead the Nation in Fighting Global Warming (“LA Green Plan/ClimateLA”) in 2007. This document outlines the goals and actions the City has established to reduce the generation and emission of GHGs from both public and private activities. Released in April 2019, L.A.’s Green New Deal provides a four year update to the City’s first Sustainable City pLAN that was first released in 2015. While not officially adopted legislation, L.A.’s Green New Deal serves as policy guidance for City agencies. Within the Green New Deal, “Climate Mitigation,” or reduction of GHG is one of eight explicit benefits that help define its strategies and goals. These include reducing GHG emissions through near-term outcomes:

- Reduce potable water use per capita by 22.5 percent by 2025; 25 percent by 2035; and maintain or reduce 2035 per capita water use through 2050.

- Reduce building energy use per square feet for all building types 22 percent by 2025; 34 percent by 2035; and 44 percent by 2050 (from a baseline of 68 mBTU/sq.ft in 2015).

- All new buildings will be net zero carbon by 2030 and 100 percent of buildings will be net zero carbon by 2050.

---

125 City of Los Angeles, Sustainable City pLAN, April 2015.
3.0 Greenhouse Gas

- Increase cumulative new housing unit construction to 150,000 by 2025; and 275,000 units by 2035.

- Ensure 57 percent of new housing units are built within 1,500 feet of transit by 2025; and 75 percent by 2035.

- Increase the percentage of all trips made by walking, biking, micro-mobility/matched rides, or transit to at least 35 percent by 2025, 50 percent by 2035, and maintain at least 50 percent by 2050.

- Reduce VMT per capita by at least 13 percent by 2025; 39 percent by 2035; and 45 percent by 2050.

- Increase the percentage of electric and zero emission vehicles in the city to 25 percent by 2025; 80 percent by 2035; and 100 percent by 2050.

- Increase landfill diversion rate to 90 percent by 2025; 95 percent by 2035 and 100 percent by 2050.

- Reduce municipal solid waste generation per capita by at least 15 percent by 2030, including phasing out single-use plastics by 2028 (from a baseline of 17.85 lbs. of waste generated per capita per day in 2011).

- Eliminate organic waste going to landfill by 2028.

- Reduce urban/rural temperature differential by at least 1.7 degrees by 2025; and 3 degrees by 2035.

- Ensure the proportion of Angelenos living within 1/2 mile of a park or open space is at least 65 percent by 2025; 75 percent by 2035; and 100 percent by 2050.

Mobility Plan 2035. Mobility Plan 2035, updated in September 2016, serves as the Mobility Element of the General Plan. Mobility Plan 2035 establishes new street designations, classifies each of the City’s arterial streets and incorporates a “complete street” policy framework (i.e., the idea that transportation facilities should be designed for all types of users, including pedestrians, cyclists, and trucks, as well as passenger vehicles), thus providing a foundation for future policies and principles promoting residents’ interaction with their streets. Discussed in detail in Section 4.10, Land Use and Planning, Mobility Plan 2035 also promotes equitable land use decisions that result in fewer vehicle trips by providing greater proximity and access to jobs, destinations, and other neighborhood services.

Existing Buildings Energy and Water Efficiency (EBEWE) Ordinance. Effective in 2017, the EBEWE Ordinance makes public the annual energy and water consumption of all buildings over 20,000 square feet in the City. Beginning in 2017, privately owned buildings that are 20,000 square feet or more and buildings owned by the City that are 7,500 or more are required to be benchmarked, and owners must disclose annual
energy and water consumption. Privately owned buildings that are 100,000 square feet or more must begin benchmarking reporting by December 1, 2017, and smaller buildings must begin reporting over the following two years. This Ordinance is designed to facilitate the comparison of buildings’ energy and water consumption, and reduce building operating costs, leading to reduced GHG emissions.

City of Los Angeles Green Building Program. In December 2010, the Los Angeles City Council adopted various provisions of the CalGreen Code as part of Ordinance No. 181,480, thus codifying certain provisions of the CalGreen Code as the new Los Angeles Green Building Code (LA Green Building Code). As a result of continuing updates to the CalGreen Code, the City adopted the pertinent provisions of the 2019 CalGreen standards through Ordinance No. 186,488, approved December 11, 2019. The LA Green Building Code applies to the construction of every new building, every new building alteration with a permit valuation of over $200,000, and every building addition unless otherwise noted. Specific mandatory requirements and elective measures are provided for three categories: (1) low-rise residential buildings; (2) non-residential and high-rise residential buildings; and (3) additions and alterations to non-residential and high-rise residential buildings. The purpose of the City’s Green Building Program is to reduce the use of natural resources, create healthier living environments and minimize the negative impacts of development on local, regional, and global ecosystems. The program consists of a Standard of Sustainability and Standard of Sustainable Excellence. The program addresses five key areas:

- Site: location, site planning, landscaping, storm water management, construction and demolition recycling;
- Water Efficiency: efficient fixtures, wastewater reuse, and efficient irrigation;
- Energy & Atmosphere: energy efficiency, and clean/renewable energy;
- Materials & Resources: materials reuse, efficient building systems, and use of recycled and rapidly renewable materials; and
- Indoor Environmental Quality: improved indoor air quality, increased natural lighting, and improved thermal comfort/control.

The Standard of Sustainability establishes a requirement for non-residential projects at or above 50,000 square feet of floor area, high-rise residential (above six stories) projects at or above 50,000 square feet of floor area, or low-rise residential (six stories or less) of 50 or more dwelling units within buildings of at least 50,000 square feet of floor area to meet the intent of the United States Green Building Council’s Leadership in Energy and Environmental Design (LEED) Certified level. The Standard also applies to
existing buildings that meet the minimum thresholds described above when redevelopment construction costs exceed a valuation of 50 percent of the existing building’s replacement cost.

The voluntary Standard of Sustainable Excellence establishes an incentive program for projects that register with the LEED program, contract with a certified LEED professional, and can demonstrate how the project will achieve LEED certification at a Silver or higher level. These projects are eligible for priority processing services within the Department of City Planning and expedited services within the Bureau of Engineering. The Department of Building and Safety.

City of Los Angeles Solid Waste Programs and Ordinances. The recycling of solid waste materials also contributes to reduced energy consumption. Specifically, when products are manufactured using recycled materials, the amount of energy that would have otherwise been consumed to extract and process virgin source materials is reduced as well as disposal energy averted. In 1989, California enacted AB 939, the California Integrated Waste Management Act, which establishes a hierarchy for waste management practices such as source reduction, recycling, and environmentally safe land disposal.

The City has developed and is in the process of implementing the Solid Waste Integrated Resources Plan, also referred to as the Zero Waste Plan, whose goal is to lead the City towards being a “zero waste” City by 2030. These waste reduction plans, policies, and regulations, along with Mayoral and City Council directives, have increased the level of waste diversion for the City to 76 percent as of 2013. The RENEW LA Plan, aims to achieve a zero waste goal through reducing, reusing, recycling, or converting the resources not going to disposal and achieving a diversion rate of 90 percent or more by 2025. The City has also approved the Waste Hauler Permit Program (Ordinance No. 181,519, LAMC Chapter VI, Article 6, Section 66.32-66.32.5), which requires private waste haulers to obtain AB 939 Compliance Permits to transport construction and demolition waste to City-certified construction and demolition waste processors. The City’s Exclusive Franchise System Ordinance (Ordinance No. 182,986), among other requirements, sets a maximum annual disposal level and diversion requirements for franchised waste haulers to promote waste diversion from landfills and support the City’s zero waste goals. These programs reduce the number of trips to haul solid waste and therefore reduce the amount of petroleum-based fuels and energy used to process solid waste.

3.3 THRESHOLDS AND METHODOLOGY

Thresholds of Significance

Consistent with Appendix G of the State CEQA Guidelines, a project would have a significant impact if it would:
3.0 Greenhouse Gas

1) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment.

2) Conflict with an applicable plan, policy or regulations adopted for the purpose of reducing the emissions of greenhouse gas emissions.

Neither the City nor the SCAQMD have adopted GHG significance thresholds applicable to the Ordinance. While the SCAQMD has adopted significance thresholds for industrial-type projects for which it is the lead agency under CEQA, those industrial thresholds are not applicable to the Ordinance. In the absence of adopted thresholds and pursuant to CEQA Guidelines Section 15064.4, the City has the discretion to use a significance threshold relevant to the Ordinance. CEQA Guidelines Section 15064.4 is stated below:

Section 15064.4. Determining the Significance of Impacts from Greenhouse Gas Emissions.

(a) The determination of the significance of greenhouse gas emissions calls for a careful judgment by the lead agency consistent with the provisions in section 15064. A lead agency shall make a good-faith effort, based to the extent possible on scientific and factual data, to describe, calculate or estimate the amount of greenhouse gas emissions resulting from a project. A lead agency shall have discretion to determine, in the context of a particular project, whether to:

(1) Quantify greenhouse gas emissions resulting from a project; and/or

(2) Rely on a qualitative analysis or performance based standards.

(b) In determining the significance of a project’s greenhouse gas emissions, the lead agency should focus its analysis on the reasonably foreseeable incremental contribution of the project’s emissions to the effects of climate change. A project’s incremental contribution may be cumulatively considerable even if it appears relatively small compared to statewide, national or global emissions. The agency's analysis should consider a timeframe that is appropriate for the project. The agency’s analysis also must reasonably reflect evolving scientific knowledge and state regulatory schemes. A lead agency should consider the following factors, among others, when determining the significance of impacts from greenhouse gas emissions on the environment:

(1) The extent to which the project may increase or reduce greenhouse gas emissions as compared to the existing environmental setting;

126 SCAQMD, SCAQMD Air Quality Significance Thresholds, 2019.
(2) Whether the project emissions exceed a threshold of significance that the lead agency determines applies to the project.

(3) The extent to which the project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of greenhouse gas emissions (see, e.g., section 15183.5(b)). Such requirements must be adopted by the relevant public agency through a public review process and must reduce or mitigate the project’s incremental contribution of greenhouse gas emissions. If there is substantial evidence that the possible effects of a particular project are still cumulatively considerable notwithstanding compliance with the adopted regulations or requirements, an EIR must be prepared for the project. In determining the significance of impacts, the lead agency may consider a project’s consistency with the State’s long-term climate goals or strategies, provided that substantial evidence supports the agency’s analysis of how those goals or strategies address the project’s incremental contribution to climate change and its conclusion that the project’s incremental contribution is not cumulatively considerable.

(c) A lead agency may use a model or methodology to estimate greenhouse gas emissions resulting from a project. The lead agency has discretion to select the model or methodology it considers most appropriate to enable decision makers to intelligently take into account the project’s incremental contribution to climate change. The lead agency must support its selection of a model or methodology with substantial evidence. The lead agency should explain the limitations of the particular model or methodology selected for use.

Methodology

Although not regulated by the Ordinance, well abandonment is a reasonably foreseeable outcome for many of the wells currently operating in the City, although as stated previously, no specific timeline for abandonment currently exists and the Ordinance does not include any regulations related to the timing of the abandonment of oil wells. As such, for purposes of this analysis, there are two distinct phases that would have the potential to change GHG emissions associated with oil and gas wells throughout the City: 1) Short-term and temporary abandonment related activities, and 2) Long-term changes to GHGs attributable to the cessation of oil and gas extraction and operations.

GHG emissions associated with short-term and temporary abandonment related activities were calculated using CalEEMod. Because these emissions would be short-term and temporary, they have been characterized as one-time GHG emission sources without the potential to increase long-term and recurring GHG emissions into the future. Long-term changes to GHGs attributable to the cessation of oil and gas...
extraction and operations have been characterized quantitively and qualitatively, and impacts have been assessed in a manner consistent with CEQA Guidelines Section 15064.4 (Determining the Significance of Impacts from Greenhouse Gas Emissions).

The City’s methodology for assessing the significance of a project’s GHG impacts generally includes 1) an evaluation of a project’s potential to generate GHG emissions, and 2) if a project does generate a net increase in GHG emissions, an evaluation if the project conflicts with an applicable plan, policy or regulation adopted for the purpose of reducing GHG emissions. Thus, because many projects in the City generate a net increase in GHG emissions, both GHG Checklist Questions are typically evaluated together. However, as discussed below, because the Ordinance would not have the potential to generate an increase in long-term GHG emissions, each Checklist Question has been evaluated individually under GHG Impact 1 and GHG Impact 2, respectively.

3.4 PROJECT IMPACTS

GHG Impact 1 Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment? (Less than Significant).

Similar to the short-term and temporary air quality impact discussion provided previously (see Section 2.6, Project Impacts, AQ Impact 2 discussion), activities associated with well abandonment also have the potential to generate short-term and temporary GHG emissions. Following the same assumptions utilized in the air quality impact discussion, the estimated abandonment related GHG emissions are summarized in Table 15, Oil & Gas Well Abandonment GHG Emissions (Per Well). Because these emissions would be short-term and temporary, they are considered one-time GHG emission sources without the potential to increase long-term and recurring GHG emissions into the future. As discussed in further detail below, long-term and recurring GHG emissions would be decreased compared to existing GHG emissions associated with oil and gas operations throughout the City as oil and gas operations cease. Although not regulated by the Ordinance, well abandonment is a reasonably foreseeable outcome for many of the wells currently operating in the City. As such, the one-time GHG emissions associated with abandonment are a
necessary step in the process to achieve long-term and recurring GHG reductions from terminating oil and gas operations throughout the City.

*While abandonment would likely occur over a short period (i.e., 10 work days), the estimate is presented in metric tons per year as this is the standard unit of measurement to describe GHG emissions. Source: Impact Sciences, September 2022. See Appendix B to this report.*

As oil and gas wells cease operation, existing GHG emission sources associated with oil and gas wells and long-term GHG emissions would be decreased compared to existing emissions associated with oil and gas wells throughout the City. The following discussion identifies the potential GHG emissions that may be avoided as a result of the Ordinance.

Long-term GHG emissions fall into two general categories: 1) worker commutes and 2) fugitive emissions. In general, fugitive emissions from oil and gas activities may be attributed to the following primary types of sources: fugitive equipment leaks; process venting; evaporation losses; disposal of waste gas streams (e.g., by venting or flaring), and accidents and equipment failures. Fugitive leaks from piping and equipment are typically small yet detectable emissions from equipment where there are joints, flanges, and seals. Although joints and flanges are typically bolted, small amounts of hydrocarbons may be emitted through leaky joints.

It should be noted that fugitive emissions are difficult to quantify with a high degree of accuracy and there remains substantial uncertainty in the emission factors and calculation methodologies for oil and gas activities. This is due to the numerous types of sources and many variables to be considered. The key emission assessment issues are: (a) use of simple production-based emission factors is susceptible to excessive errors; (b) use of rigorous bottom-up approaches requires expert knowledge to apply and relies on detailed data which may be difficult and costly to obtain; and (c) measurement programs are time...
consuming and very costly to perform.\textsuperscript{127} Nevertheless, Table 16, \textit{Avoided Oil & Gas GHG Emissions}, has been included as a good-faith effort to illustrate the potential scope of GHG emissions that may be avoided as a result of the Ordinance.\textsuperscript{128} Due to the programmatic nature of this analysis and the many variables at each oil and gas well throughout the City, the quantified estimates in Table 16 are included for illustrative purposes. Furthermore, while it is clear the Ordinance would result in a net benefit to local and regional GHG emissions, the degree to which GHG emissions may be avoided under the Ordinance is not the basis for the impact determination. Because the Ordinance would reduce long-term GHG emissions compared to existing emissions associated with oil and gas wells throughout the City, the Ordinance would not generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment. Furthermore, as discussed in \textbf{GHG Impact 2}, the Ordinance would not conflict with an applicable plan, policy or regulation adopted for the purpose of reducing GHG emissions. Therefore, this impact is \textit{less than significant}.

\begin{table}[h]
\centering
\begin{tabular}{|l|c|}
\hline
\textbf{Emissions Source} & \textbf{Metric Tons of Carbon Dioxide Equivalent (per year)} \\
\hline
Worker Emissions & 142 \\
Fugitive Emissions & 9,827 \\
\hline
Total Avoided GHG Emissions & 9,969 \\
\hline
\end{tabular}
\caption{Avoided Oil & Gas GHG Emissions}
\end{table}

\textsuperscript{*} As described previously herein, abandonment of individual wells may occur at any time during the 20-year timeframe, and potentially beyond the 20-year timeframe. It would be speculative to assess how many wells would be abandoned during a given year, month, or peak day. Thus, the total avoided GHG emissions estimated here represents the annual metric tons per year upon abandonment of all wells.

Source: Impact Sciences, September 2022. See Appendix B to this report.

\textbf{GHG Impact 2} \quad Would implementation of the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases? (\textit{Less than Significant}).

As discussed previously, AB 32 required CARB to adopt a scoping plan indicating how reductions in significant GHG sources will be achieved through regulations, market mechanisms, and other actions. In 2008, CARB released the Climate Change Proposed Scoping Plan in October 2008 that contained an outline

\textsuperscript{127} Intergovernmental Panel on Climate Change, Good Practice Guidance and Uncertainty Management in National Greenhouse Gas Inventories, Fugitive Emissions From Oil and Natural Gas Activities.

\textsuperscript{128} See Appendix B to this report for further information related to calculations and assumptions utilized to prepare these estimates.
of the proposed state strategies to achieve the 2020 greenhouse gas emission limits as outlined in AB 32. In response to SB 32, CARB adopted California’s 2017 Climate Change Scoping Plan (2017 Update), which outlines the proposed framework of action for achieving California’s SB 32 2030 GHG target: a 40 percent reduction in GHG emissions by 2030 relative to 1990 levels. The 2030 target is intended to ensure that California remains on track to achieve the goal set forth by E.O. B-30-15 to reduce statewide GHG emissions by 2050 to 80 percent below 1990 levels.

The Ordinance would be consistent with the objectives of CARB’s Scoping Plan, which is intended to reduce GHG emissions in accordance with AB 32 and SB 32. The Scoping Plan provides a framework for actions to reduce California’s GHG emissions and requires CARB and other state agencies to adopt regulations and other strategies to reduce GHGs. Most of these measures focus on area source emissions (e.g., energy production, distribution and usage, and high-GWP GHGs in consumer products) and changes to the vehicle fleet (i.e., hybrid, electric, and more fuel-efficient vehicles) and associated fuels (e.g., Low Carbon Fuel Standard), among others. The Ordinance would comply with all regulations adopted in furtherance of the Scoping Plan to the extent required by law and to the extent that they are applicable to the Ordinance. For example, abandonment activities will utilize equipment in compliance with regulations set forth by CARB. Mobile sources during abandonment would be subject to the requirements of California Assembly Bill 1493 (Pavley Standards), the Advanced Clean Cars Program, and the Low Carbon Fuel Standard Regulation. Additionally, while the Ordinance is not a GHG reduction plan, the Ordinance is a reflection of state, regional, and local goals to move away from reliance on oil and gas energy sources which will serve to reduce long-term GHG emissions and help the State achieve the GHG reductions mandated in AB 32 and SB 32. The State has enacted numerous legislative regulations to address climate change by reducing our dependence on fossil fuels to reduce GHG emissions. California’s Renewable Portfolio Standards established by Senate Bill 1078 requires that 60% of our electricity generation be produced from clean renewable sources by 2030 and become carbon-free by 2045. This has contributed to California’s move away from electricity powered by coal and natural gas and a progressive increase in the use of solar and wind energy sources. This has occurred for both utility scale energy generation as well as for new single-family residential uses which are required to meet their electricity needs by installing solar panels under the State’s Title 24 building standards. For passenger vehicles, Executive Order N-79-20 would ban the sales of new gasoline and diesel passenger vehicles while requiring that only new zero-emission vehicles be sold by 2035. This Executive Order is also consistent with CARB’s regulations transitioning from diesel trucks and vans to zero emission trucks, and public bus fleets to be fully electric by 2040. See also Tables 4 and 5 in the Ordinance’s Initial Study for a comprehensive list of state, regional, and City policies that support the Ordinance). Thus, because the Ordinance is consistent with state, regional, and local goals to move away

129  CARB, California’s 2017 Climate Change Scoping Plan, November 2017.
from reliance on oil and gas energy sources, the Ordinance would not have the potential to conflict with an applicable plan, policy or regulation adopted for the purpose of reducing GHG emissions and this impact is less than significant.

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

1.0 INTRODUCTION

This Noise and Vibration Technical Report describes the potential for noise and groundborne vibration impacts resulting from implementation of the proposed Oil and Gas Drilling Ordinance (Ordinance or Project) to prohibit new oil and gas extraction and make existing extraction activities a nonconforming use in all zones within the City of Los Angeles (City). This report includes an evaluation of potential impacts associated with substantial temporary and permanent changes in ambient noise levels in the vicinity of oil and gas wells; exposure of people in the vicinity of oil and gas wells to excessive noise or groundborne vibration levels; and whether exposure is in excess of standards established in the City’s General Plan or Noise Ordinance. This report has been prepared by Impact Sciences, Inc., in support of the environmental documentation being prepared pursuant to the California Environmental Quality Act (CEQA).

1.1 PROJECT LOCATION

The Project is a citywide code amendment applicable within the boundaries of the City. The City has an approximate land area of 465 square miles (297,600 acres) with an estimated population of nearly 4.0 million residents in 2020 (3,898,747), according to the 2020 Census. The City lies within Los Angeles County which encompasses 4,000 square miles, 88 incorporated cities, and more than 10 million residents (10,014,009), according to the 2020 Census. The City is divided into 15 Council Districts and 35 Community Plan Areas. More than 87 percent of the City is developed with urban uses.

According to August 2022 data from the California Geologic Energy Management division (CalGEM), the City has 26 oil and gas fields that intersect city boundaries and 5,273 oil and gas wells. There are approximately 641 active, 1,350 idle, 35 canceled, and 3,247 plugged wells.\(^1\) Of the City’s idle wells, as of July 2022, 56 are orphan wells likely to have no responsible solvent operator. There are oil and gas facilities in nearly every section of the City.\(^2\) While some wells are situated in heavy industrial areas, others are located within residential neighborhoods and amongst community parks and schools. Much of the existing oil drilling and extraction is within underserved communities throughout the City.

Wells are found in nearly all parts of the City including but not limited to the communities of Wilmington, Harbor Gateway, Downtown, West Los Angeles, South Los Angeles, and the Northeast San Fernando

---

\(^1\) An active well is an oil well that has been drilled and completed, an idle well is inactive and not producing, but capable of being reactivated, a canceled well is one where a well permit was canceled prior to drilling, and a plugged well has been plugged and sealed to current standards.

\(^2\) There are two gas storage fields within the City, the Aliso Canyon and the Playa Del Rey Fields, which are both operated by the Southern California Gas Company (SoCalGas). SoCalGas is the primary operator of underground natural gas fields, natural gas storage wells, and natural gas transmission facilities within the City. No natural gas wells operated by public utilities would be impacted by the Ordinance.
1.0 Introduction

Valley. While some wells are situated in heavy industrial areas, others are located in neighborhoods within close proximity to residences, schools, and other sensitive uses. For a list of sensitive receptors located in proximity to wells throughout the City, please refer to Appendix A to this report.

1.2 PROJECT DESCRIPTION

The Project is a proposed ordinance amending Sections 12.03, 12.20, 12.23, 12.24, and 13.01 of the Los Angeles Municipal Code (LAMC) to (1) eliminate the provisions of the LAMC that allow for the creation of new “O” Oil Drilling Supplemental Use Districts; (2) end by-right oil and gas extraction in the M3-Heavy Industrial Zones; (3) declare existing oil and gas extraction within the City a nonconforming use to terminate within 20 years; and (4) prohibit new or expanded oil and gas extraction activities (such as the drilling of new wells or the redrilling or deepening of existing wells). The Ordinance permits maintenance of the wells that the Zoning Administrator determines is necessary to protect public health and safety or the environment. Twenty years from the effective date of the Ordinance, all nonconforming oil and gas extraction uses will terminate.

This Ordinance is not applicable to (1) common carrier oil pipelines intended for regionally-coordinated transport of hydrocarbons; (2) service stations or like uses; (3) refineries; and (4) oil and injection wells that are verified to be plugged and abandoned in accordance with all applicable local, state, and federal laws, rules and regulations, including the California Statutes and Regulations overseen by the California Geologic Energy Management division (CalGEM), and LAFD and for which the well pad has been restored suitably for its subsequent use, and (5) any well operated by a public utility regulated by the California Public Utilities Commission, including those operating at the Aliso Canyon and Playa Del Rey Gas Storage Fields.

The Ordinance does not set a specific timetable for the closure and abandonment of wells, regulate the abandonment of oil wells that have permanently ceased operation, or mandate or regulate the remediation of well sites where extraction has terminated permanently.  

The Ordinance will make existing oil and gas drilling operations legally nonconforming uses in the City, subject to a 20-year amortization period. Existing oil and gas extraction activities may continue to operate until the end of the amortization period after which time all drilling-related activities must cease. After a well ceases operation, current regulations require that the well be abandoned and plugged. However, the

---

3 Public Resources Code Section 21000 requires that a lead agency identify all feasible mitigation measures that will avoid or substantially lessen the significant environmental effects of the project. This MND identifies areas of potentially significant impacts that would occur as a result of abandonment activities (See Noise, Geology and Soils). In accordance with CEQA, mitigation measures are proposed where such impacts could be reduced by their imposition.
current regulations do not establish a set time period by which the abandonment process must be completed after a well ceases operation. As stated above, the Ordinance does not regulate abandonment when well operations permanently cease.

Currently it is unknown as to how many oil wells will permanently cease operations prior to the 20 year expiration date. This is because the time period that each of the City’s approximately 1,991 active and idle wells will permanently cease extraction and undergo abandonment depends on a number of individual factors. For example, upon the Ordinance becoming effective, some operators may choose to conclude operations immediately, while others may have contractual obligations to the landowners of the drilling sites and operate for a few years before the site is abandoned. Others may continue to operate until the end of the 20-year amortization period. However, once a well permanently ceases operation, there is a financial and economic incentive for the oil well operator to complete the abandonment process to reduce the costs of maintaining the well site. Therefore, because there is no reasonable way to accurately predict the timeline for cessation and abandonment at the individual level, this analysis instead assumes all oil drilling will cease 20 years from the effective date of the Ordinance as required. Abandonment of individual wells may occur at any time during the 20-year timeframe, and potentially beyond the 20-year timeframe.

Although not regulated by the Ordinance, well abandonment is a reasonably foreseeable outcome for many of the wells currently operating in the City, although as stated above, no specific timeline for abandonment currently exists and the Ordinance does not include any regulations related to the timing of the abandonment of oil wells. When a well is shut down, termination and abandonment activities will generally include (1) the cessation of production and drilling operations; (2) the closure and plugging of all oil and gas wells, including water flooding injection wells, except injection wells as permitted and demonstrated to be active and necessary by CalGEM; and (3) the plugging/capping of subsurface pipelines. Neither implementation of the Ordinance nor the oil well abandonment process should require excavation of previously undisturbed land and no new permanent structures would be constructed as part of the Project.

Termination activities of nonconforming oil and gas extraction must adhere to all applicable local, state, and federal laws, regulations, rules and standards, including the California Statutes and Regulations and all other requirements overseen by CalGEM as the principal regulatory authority for the closure of oil and gas extraction and production sites. Termination and abandonment activities will occur within previously disturbed and developed areas of the properties that encompass oil and gas extraction activities. In some cases, new access points may be necessary to allow for ingress/egress of equipment necessary to complete the abandonment of wells. However, no new permanent roads or permanent changes to existing roads would be necessary as part of the Project.
1.0 Introduction

The closure of oil and gas wells entails plugging the wells in place in accordance with California Statutes and Regulations and all other applicable requirements as overseen by CalGEM. The process of well abandonment will be determined on a case-by-case basis under the regulatory supervision of CalGEM and the LAFD and will depend on individual site conditions such as type and depth of well. However, for the purposes of this environmental analysis, several generalized assumptions have been made based upon standard industry practice, existing regulations governing well abandonment, and case studies. While plugging and abandonment varies by well, there is a consistent set of procedures that are followed. Generally, the drill site’s existing drilling or maintenance rig will be used to abandon the well and remove equipment from the well. Well equipment will be removed from the site by truck. Cement trucks will also arrive onsite to fill the well at various depths over a span of several days. An operator may use in excess of 2,500 cubic feet of cement for one abandonment. The process entails removing equipment and filling the well with cement at different phases in order to ensure that it is safe to abandon the well at varying depths. At the end of each work day, the well site is closed and the rig is shut down in order to resume operations the following work day. CalGEM conducts inspections at certain milestones for this scope of work, including the following:

- Operators conduct a series of pressure tests on the wells to identify that there are no leaks or that the pressure is unsafe to work on the well. A test to measure any levels of hydrogen sulfide is common.

- Operators use a drilling or maintenance rig to work on the well and prepare blowout prevention equipment for the well that will be plugged.

- CalGEM inspects the blowout prevention equipment to ensure that it is safe for the operator to continue with plugging and abandonment work.

- Operators use the rig to pull out various cables, tubing, and other connections from the well casing.

- Operators may require the use of brine water to clean out different segments of the well. If no debris or sand is observed, then the operators continue using the rig to remove cables, tubing, and more connections from the well.

- After the operator has removed the sufficient amount of tubings, casing, and connections and there are minimal amounts of debris observed, then the operator will bring a cement truck to begin pouring fresh water and cement mix down the well. CalGEM is required to observe this first segment of pouring

---

4 When a drilling or maintenance rig is not on the well site, a rig will need to be brought to the site to complete the abandonment process.
as the inspector is looking to observe that the bottom hole is filled with the appropriate amount of cement.

- The operator continues to remove casings and tubings with support of the rig while also pouring cement down the well at depths deemed safe and clear enough to pour cement. Pressure testing of the well is frequently conducted to identify any safety risks.

- As the work nears the top segment of the well, the operator continues to use the rig and cement trucks are brought to the drill site to fill the well with cement. The ending segment can include up to 600 cubic feet of cement into the well’s casings in order to displace any well fluids or debris. The operator will fill the well casing to the near very top and this process is observed by CalGEM and by the Los Angeles Fire Department.

- At the conclusion, the operator removes any blowout prevention equipment from the rig and the well is closed and steel welded with the API Number and the LAFD Well Number identified on the top cover.

Given the varied timeline of individual well abandonment and the fact the Ordinance does not establish any regulations related to well site remediation or redevelopment (except where mitigation measures are required to reduce identified potentially significant impacts), it would be speculative to contemplate when site remediation would occur after the wells are abandoned and the types of redevelopment and future land uses that may occur on former drill sites. What might get built and at what intensity or scale is not possible to identify or analyze at this time. Therefore, the scope of analysis in this Initial Study is limited to (1) cessation of oil and gas extraction in the city and (2) abandonment activities that are reasonably foreseeable. The analysis does not examine impacts from remediation and/or future development. Those impacts would be analyzed in subsequent environmental analyses at either the programmatic or project level.
2.0 ENVIRONMENTAL SETTING

2.1 FUNDAMENTALS OF NOISE & VIBRATION

Noise

Noise is usually defined as unwanted sound that is an undesirable byproduct of society’s normal day-to-day activities. Sound becomes unwanted when it interferes with normal activities, when it causes actual physical harm, and/or when it has adverse effects on health. Noise is measured on a logarithmic scale of sound pressure level known as a decibel (dB). The human ear does not respond uniformly to sounds at all frequencies. For example, the human ear is less sensitive to low and high frequencies than medium frequencies, which more closely correspond with human speech. In response to the sensitivity of the human ear to different frequencies, the A-weighted noise level (or scale), which corresponds better with people’s subjective judgment of sound levels, has been developed. This A-weighted sound level, referenced in units of dB(A), is measured on a logarithmic scale such that a doubling of sound energy results in a 3 dB(A) increase in noise level. Typically, changes in a community noise level of less than 3 dB(A) are not noticed by the human ear. Changes from 3 to 5 dB(A) may be noticed by some individuals who are sensitive to changes in noise. A greater than 5 dB(A) increase is readily noticeable, while the human ear perceives a 10 dB(A) increase in sound level to be a doubling of sound.

On the A-weighted scale, the range of human hearing extends from approximately 3 to 140 dB(A). Table 1, A-Weighted Decibel Scale, provides examples of A-weighted noise levels from common sources. Noise sources occur in two forms: (1) point sources, such as stationary equipment or individual motor vehicles; and (2) line sources, such as a roadway with a large number of point sources (motor vehicles). Sound generated by a point source typically diminishes (attenuates) at a rate of 6 dB(A) for each doubling of distance from the source to the receptor at acoustically “hard” sites and 7.5 dB(A) at acoustically “soft” sites. For example, if a noise source produces a noise level of 89 dB(A) at a reference distance of 50 feet, the noise level would be 83 dB(A) at a distance of 100 feet from the noise source, 77 dB(A) at a distance of 200 feet, and so on. Noise generated by a mobile source will decrease by approximately 3 dB(A) over hard surfaces and 4.5 dB(A) over soft surfaces for each doubling of distance.

---

6 Federal Highway Administration, *Highway Noise Fundamentals*, (1980) 97. Examples of “hard” or reflective sites include asphalt, concrete, and hard and sparsely vegetated soils. Examples of acoustically “soft” or absorptive sites include soft, sand, plowed farmland, grass, crops, heavy ground cover, etc.

</tr>
</tbody>
</table>

Sound levels also can be attenuated by man-made or natural barriers (e.g., sound walls, berms, and ridges), as well as elevational differences. Noise is most audible when traveling by direct line-of-sight, an interrupted visual path between the noise source and noise receptor. Barriers, such as walls or buildings that break the line-of-sight between the source and the receiver, can greatly reduce noise levels from the source since sound can only reach the receiver by diffraction. However, if a barrier is not high or long enough to break the line-of-sight from the source to the receiver, its effectiveness is greatly reduced.

Solid walls and berms may reduce noise levels by 5 to 10 dB(A) depending on their height and distance relative to the noise source and the noise receptor. Sound levels may also be attenuated 3 dB(A) by a first row of houses and 1.5 dB(A) for each additional row of houses. The minimum noise attenuation provided by typical structures in California is provided in Table 2, **Building Noise Reduction Factors**.

**Sound Rating Scales**

Various rating scales approximate the human subjective assessment to the “loudness” or “noisiness” of a sound. Noise metrics have been developed to account for additional parameters, such as duration and cumulative effect of multiple events. Noise metrics are categorized as single event metrics and cumulative metrics, as summarized below.

In order to simplify the measurement and computation of sound loudness levels, frequency weighted networks have obtained wide acceptance. The A-weighted scale, discussed above, has become the most prominent of these scales and is widely used in community noise analysis. Its advantages are that it has shown good correlation with community response and is easily measured. The metrics used in this analysis are all based upon the dB(A) scale.

**Equivalent Noise Level**

Equivalent Noise Level (Leq) is the sound level corresponding to a steady-state A-weighted sound level containing the same total energy as several single event noise exposure level events during a given sample period. Leq is the “acoustic energy” average noise level during the period of the sample. It is based on the observation that the potential for noise annoyance is dependent on the total acoustical energy content of the noise. The equivalent noise level is expressed in units of dB(A). Leq can be measured for any period, but is typically measured for 15 minutes, 1 hour, or 24 hours. Leq for a 1-hour period is used by the Federal Highway Administration (FHWA) for assessing highway noise impacts. Leq for 1 hour is referred to as the Hourly Noise Level (HNL) in the California Airport Noise Regulations and is used to develop Community
2.0 Environmental Setting

Noise Equivalent Level values for aircraft operations. Construction noise levels and ambient noise measurements in this section use the Leq scale.

Community Noise Equivalent Level

Community Noise Equivalent Level (CNEL) is a 24-hour, time-weighted energy average noise level based on the A-weighted decibel. It is a measure of the overall noise experienced during an entire day. The term “time-weighted” refers to the penalties attached to noise events occurring during certain sensitive periods. In the CNEL scale, 5 decibels (dB) are added to measured noise levels occurring between the hours of 7 P.M. and 10 P.M. For measured noise levels occurring between the hours of 10 P.M. and 7 A.M., 10 dB are added. These decibel adjustments are an attempt to account for the higher sensitivity to noise in the evening and nighttime hours and the expected lower ambient noise levels during these periods. Existing and projected future traffic noise levels in this section use the CNEL scale.

Day-Night Average Noise Level

The day-night average sound level (Ldn) is another average noise level over a 24-hour period. Noise levels occurring between the hours of 10 P.M. and 7 A.M. are increased by 10 dB. This noise is weighted to take into account the decrease in community background noise of 10 dB(A) during this period. Noise levels measured using the Ldn scale are typically similar to CNEL measurements.

Adverse Effects of Noise Exposure

Noise is known to have several adverse effects on humans, which has led to laws and standards being set to protect public health and safety, and to ensure compatibility between land uses and activities. Adverse effects of noise on people include hearing loss, communication interference, sleep interference, physiological responses, and annoyance. Each of these potential noise impacts on people is briefly discussed in the following narrative.

Hearing Loss

Hearing loss is generally not a community noise concern, even near a major airport or a major freeway. The potential for noise-induced hearing loss is more commonly associated with occupational noise exposures in heavy industry, very noisy work environments with long-term exposure, or certain very loud recreational activities (e.g., target shooting and motorcycle or car racing). The Occupational Safety and Health Administration (OSHA) identifies a noise exposure limit of 90 dB(A) for 8 hours per day to protect from hearing loss (higher limits are allowed for shorter duration exposures). Noise levels in neighborhoods, even in very noisy neighborhoods, are not sufficiently loud enough to cause hearing loss.
2.0 Environmental Setting

Communication Interference

Communication interference is one of the primary concerns in environmental noise. Communication interference includes speech disturbance and intrusion with activities such as watching television. Noise can also interfere with communications such as within school classrooms. Normal conversational speech is in the range of 60 to 65 dB(A) and any noise in this range or louder may interfere with speech.

Sleep Interference

Noise can make it difficult to fall asleep, create momentary disturbances of natural sleep patterns by causing shifts from deep to lighter stages, and cause awakening. Noise may even cause awakening that a person may or may not be able to recall.

Physiological Responses

Physiological responses are those measurable effects of noise on people that are realized as changes in pulse rate, blood pressure, and other physical changes. Studies to determine whether exposure to high noise levels can adversely affect human health have concluded that, while a relationship between noise and health effects seems plausible, there is no empirical evidence of the relationship.

Annoyance

Annoyance is an individual characteristic and can vary widely from person to person. Noise that one person considers tolerable can be unbearable to another of equal hearing capability. The level of annoyance depends both on the characteristics of the noise (including loudness, frequency, time, and duration), and how much activity interference (such as speech interference and sleep interference) results from the noise. However, the level of annoyance is also a function of the attitude of the receiver. Attitudes may also be affected by the relationship between the person affected and the source of noise, and whether attempts have been made to abate the noise.

Vibration

Vibration consists of waves transmitted through solid material. Groundborne vibration propagates from a source through the ground to adjacent buildings by surface waves. Vibration may comprise a single pulse, a series of pulses, or a continuous oscillatory motion. The frequency of a vibrating object describes how rapidly it is oscillating and is measured in hertz (Hz). Most environmental vibrations consist of a composite, or “spectrum” of many frequencies, and are generally classified as broadband or random vibrations. The normal frequency range of most groundborne vibration that can be felt generally starts from a low frequency of less than one Hz to a high of about 200 Hz. Vibration is often measured in terms of the peak
2.0 Environmental Setting

particle velocity (PPV) in inches per second (in/sec) when considering impacts on buildings or other structures, as PPV represents the maximum instantaneous peak of vibration that can stress buildings. Because it is a representation of acute vibration, PPV is often used to measure the temporary impacts of short-term construction activities that could instantaneously damage-built structures. Vibration is often also measured by the root mean squared (RMS) because it best correlates with human perception and response. Specifically, RMS represents “smoothed” vibration levels over an extended period of time and is often used to gauge the long-term chronic impact of a project’s operation on the adjacent environment. RMS amplitude is the average of a signal’s squared amplitude. It is most commonly measured in decibel notation (VdB).

Vibration energy attenuates as it travels through the ground, causing the vibration amplitude to decrease with distance away from the source. High frequency vibrations reduce much more rapidly than low frequencies, so that in the far-field from a source, the low frequencies tend to dominate. Soil properties also affect the propagation of vibration. When groundborne vibration interacts with a building, there is usually a ground-to-foundation coupling loss (i.e., the foundation of the structure does not move in sync with the ground vibration), but the vibration can also be amplified by the structural resonances of the walls and floors. Vibration in buildings is typically perceived as rattling of windows or items on shelves, or the motion of building surfaces. At high levels, vibration can result in damage to structures.

Manmade groundborne vibration is generally limited to areas within a few hundred feet of certain types of construction activities, especially pile driving. Road vehicles rarely create enough groundborne vibration to be perceptible to humans unless the road surface is poorly maintained and there are potholes or bumps. If traffic induces perceptible vibration in buildings, such as window rattling or shaking of small loose items (typically caused by heavy trucks in passing), then it is most likely an effect of low-frequency airborne noise or ground characteristics. Human annoyance by vibration is related to the number and duration of events. The more events or the greater the duration, the more annoying it will be to humans.

2.2 NOISE SENSITIVE RECEPTORS

Noise-sensitive land uses are generally considered to include those uses where noise exposure could result in health-related risks to individuals, as well as places where quiet is an essential element of their intended purpose. Residential dwellings are of primary concern because of the potential for increased and prolonged exposure of individuals to both interior and exterior noise levels. In addition to the numerous parcels zoned for residential uses in proximity to oil wells throughout the City, there are approximately 766 noise-
sensitive uses within 100 feet of oil wells. These noise sensitive land uses consist of schools, day cares, elder care facilities, adult residential facilities, parks, and hospitals. Please refer to Appendix A to this report for more information related to noise sensitive receptors located in proximity to oil wells.

2.3 EXISTING CONDITIONS

The City is affected by a variety of noise sources, including mobile and stationary sources. Mobile noise in the City is primarily generated by automobiles, trucks, and aircraft such as airplane and helicopter overflight. Motor vehicle noise generally affects numerous receptors along lengths of roadways. Stationary source noise is primarily generated by industrial and commercial land uses; however, all land uses can generate some type of noise.

Oil and gas well operations also contribute to the ambient noise levels at receptors in proximity to active wells. The types of noise associated with oil and gas operations can be complex in nature, due to a wide variety of sources. Some of these noises are intermittent, some are continuous, and many vary in their intensity. Certain sources, such as compressor stations, produce low frequency noise (LFN), which is typically heard as a low rumble. There are also numerous source-dependent and subjective factors that may influence health outcomes, such as noise sensitivity and noise reduction technologies employed at specific locations. While data on noise levels associated with oil and gas development is limited, Table 3, Noise Levels Associated With Oil and Gas Operations, identifies estimated noise levels associated with various oil and gas production activities.

---

9 Due to the programmatic nature of this analysis, it is acknowledged that not every noise sensitive receptor will be identified. However, a good-faith effort at identifying the known sensitive receptors has been included in Appendix A to this report. Sensitive receptors within 100 feet of oil wells were selected to conservatively identify a range of noise and vibration levels at locations in proximity to oil wells. As shown in the analysis herein, sensitive receptors located more than 50 feet from oil wells would not experience potentially significant noise and vibration levels during potential abandonment activities.

3.0 REGULATORY FRAMEWORK

3.1 REGULATORY FRAMEWORK

There are several plans, regulations, and programs that include policies, requirements, and guidelines regarding noise and vibration at the federal, state, regional, and local levels. As described below, these plans, guidelines, and laws include the following:

- Occupational Safety and Health Act of 1970
- Noise Control Act of 1972
- Federal Transit Administration Vibration Standards
- Office of Planning and Research Guidelines for Noise Compatible Land Use
- Caltrans Vibration/Groundborne Noise Standards
- Los Angeles County Airport Land Use Commission Comprehensive Land Use Plan
- Los Angeles Municipal Code
- City of Los Angeles General Plan Noise Element

Federal

Occupational Safety and Health Act of 1970. Under the Occupational Safety and Health Act of 1970 (29 U.S.C. §1919 et seq.), the Occupational Safety and Health Administration (OSHA) has adopted regulations designed to protect workers against the effects of occupational noise exposure. These regulations list permissible noise level exposure as a function of the amount of time during which the worker is exposed. The regulations further specify a hearing conservation program that involves monitoring noise to which workers are exposed, ensuring that workers are made aware of overexposure to noise, and periodically testing the workers’ hearing to detect any degradation.10

Noise Control Act of 1972. Under the authority of the Noise Control Act of 1972, the United States Environmental Protection Agency (U.S. EPA) established noise emission criteria and testing methods published in Parts 201 through 205 of Title 40 of the Code of Federal Regulations (CFR) that apply to some transportation equipment (e.g., interstate rail carriers, medium trucks, and heavy trucks) and construction equipment. In 1974, U.S. EPA issued guidance levels for the protection of public health and welfare in

regulatory framework

Impact Sciences, Inc.

City of Los Angeles Oil & Gas Drilling Ordinance
Noise & Vibration Technical Report - September 2022

3.0 Regulatory Framework

residential areas of an outdoor $L_{dn}$ of 55 dBA and an indoor $L_{dn}$ of 45 dBA. These guidance levels are not standards or regulations and were developed without consideration of technical or economic feasibility. There are no federal noise standards that directly regulate environmental noise related to the construction or operation of the Project. Moreover, the federal noise standards are not reflective of urban environments that range by land use, density, proximity to commercial or industrial centers, etc. As such, for purposes of determining acceptable sound levels to determine and evaluate intrusive noise sources and increases, this document utilizes the City of Los Angeles Noise Regulations, discussed below.

Federal Transit Administration Vibration Standards. There are no federal vibration standards or regulations adopted by any agency that are applicable to evaluating vibration impacts from activities associated with the Project. However, the Federal Transit Administration (FTA) has adopted vibration criteria for use in evaluating vibration impacts from construction activities. The vibration damage criteria adopted by the FTA are shown in Table 4, Construction Vibration Damage Criteria.

Table 4
Construction Vibration Damage Criteria

<table>
<thead>

</tr>
<tr>
<td>III. Non-engineered timber and masonry buildings</td>
<td>0.2</td>
</tr>
<tr>
<td>IV. Buildings extremely susceptible to vibration damage</td>
<td>0.12</td>
</tr>
</tbody>
</table>

The FTA has also adopted standards associated with human annoyance for determining the groundborne vibration and noise impacts from ground-borne noise on the following three off-site land-use categories: Vibration Category 1 – High Sensitivity, Vibration Category 2 – Residential, and Vibration Category 3 – Institutional. The FTA defines Category 1 as buildings where vibration would interfere with operations within the building, including vibration-sensitive research and manufacturing facilities, hospitals with vibration-sensitive equipment, and university research operations. Vibration-sensitive equipment includes, but is not limited to, electron microscopes, high-resolution lithographic equipment, and normal optical microscopes. Category 2 refers to all residential land uses and any buildings where people sleep, such as hotels and hospitals. Category 3 refers to institutional land uses such as schools, churches, other

institutions, and quiet offices that do not have vibration-sensitive equipment but that still potentially involve activities that could be disturbed by vibration. The vibration thresholds associated with human annoyance for these three land-use categories are shown in Table 5, *Groundborne Vibration and Groundborne Noise Impact Criteria for General Assessment*. No thresholds have been adopted or recommended for commercial or office uses.

### Table 5

*Groundborne Vibration and Groundborne Noise Impact Criteria for General Assessment*

</tbody>
</table>

<sup>a</sup> “Frequent Events” is defined as more than 70 vibration events of the same source per day.

<sup>b</sup> “Occasional Events” is defined as between 30 and 70 vibration events of the same source per day.

<sup>c</sup> “Infrequent Events” is defined as fewer than 30 vibration events of the same kind per day.

<sup>d</sup> This criterion is based on levels that are acceptable for most moderately sensitive equipment such as optical microscopes.

### State

**Office of Planning and Research Guidelines for Noise Compatible Land Use.** The State of California has not adopted statewide standards for environmental noise, but the Governor’s Office of Planning and Research (OPR) has established guidelines for evaluating the compatibility of various land uses as a function of community noise exposure. The City has developed its own compatibility guidelines in the Noise Element of the General Plan based in part on OPR Guidelines, see *Table 7, Guidelines for Noise Compatible Land Use (CNEL)* later in this report. California Government Code Section 65302 requires each county and city in the State to prepare and adopt a comprehensive long-range general plan for its physical development, with Section 65302(f) requiring a noise element to be included in the general plan. The noise element must: (1) identify and appraise noise problems in the community; (2) recognize Office of Noise Control guidelines; and (3) analyze and quantify current and projected noise levels.

**Caltrans Vibration/Groundborne Noise Standards.** The State of California has not adopted Statewide standards or regulations for evaluating vibration or groundborne noise impacts from land use...
development projects. Although the State has not adopted any vibration standard, Caltrans recommends the following vibration thresholds that are more practical than those provided by the FTA.\textsuperscript{12}

The state noise and vibration guidelines are to be used as guidance with respect to planning for noise, not standards and/or regulations to which the City of Los Angeles must adhere.

\textsuperscript{1} Transient sources create a single, isolated vibration event, such as blasting or drop balls.

\textsuperscript{2} Continuous/frequent intermittent sources include impact pile drivers, pogo-stick compactors, crack-and-seat equipment, vibratory pile drivers, and vibratory compaction equipment.

\section*{Local}

\textbf{Los Angeles Municipal Code}. The City of Los Angeles Noise Regulations are provided in Chapter XI of the Los Angeles Municipal Code (LAMC). LAMC Section 111.02 provides procedures and criteria for the measurement of the sound level of “offending” noise sources. In accordance with the LAMC, a noise source that causes a noise level increase of 5 dBA over the existing average ambient noise level as measured at an adjacent property line creates a noise violation. This standard applies to radios, television sets, air conditioning, refrigeration, heating, pumping and filtering equipment, powered equipment intended for repetitive use in residential areas, and motor vehicles driven on-site. To account for people’s increased tolerance for short-duration noise events, the Noise Regulations provide a 5 dBA allowance for a noise violation.

source that causes noise lasting more than 5 but less than 15 minutes in any one-hour period, and an additional 5 dBA allowance (for a total of 10 dBA) for a noise source that causes noise lasting 5 minutes or less in any one-hour period.\(^\text{13}\)

The LAMC provides that in cases where the actual ambient conditions are not known, the City’s presumed daytime (7:00 a.m. to 10:00 p.m.) and nighttime (10:00 p.m. to 7:00 a.m.) minimum ambient noise levels as defined in LAMC Section 111.03 should be used. The presumed ambient noise levels for these areas where the actual ambient conditions are not known as set forth in the LAMC Sections 111.03 are provided in Table 7, City of Los Angeles Presumed Ambient Noise Levels. For example, for residential-zoned areas, the presumed ambient noise level is 50 dBA during the daytime and 40 dBA during the nighttime.

Source: LAMC Section 111.03.

LAMC Section 112.02 limits increases in noise levels from air conditioning, refrigeration, heating, pumping and filtering equipment. Such equipment may not be operated in such manner as to create any noise which would cause the noise level on the premises of any other occupied property, or, if a condominium, apartment house, duplex, or attached business, within any adjoining unit, to exceed the ambient noise level by more than 5 dB.

LAMC Section 112.04 prohibits the operation of any lawn mower, backpack blower, lawn edger, riding tractor, or any other machinery equipment, or other mechanical or electrical device, or any hand tool that creates a loud, raucous or impulsive sound, within any residential zone or within 500 feet of any residence between 10:00 PM and 7:00 AM. Section 113.01 prohibits rubbish and garbage collection within 200 feet of any residence between 9:00 PM and 6:00 AM.

\(^\text{13}\) Los Angeles Municipal Code, Chapter XI, Article I, Section 111.02-(b).
3.0 Regulatory Framework

LAMC Section 112.05 sets a maximum noise level for construction equipment of 75 dBA at a distance of 50 feet when operated within 500 feet of a residential zone. Compliance with this standard shall not apply where compliance therewith is technically infeasible. Specifically, such activities may be allowed when it is demonstrated that compliance is not possible “despite the use of mufflers, shields, sound barriers, and/or other noise reduction device or techniques during the operation of the equipment.”

LAMC Section 41.40 prohibits construction between the hours of 9:00 p.m. and 7:00 a.m. Monday through Friday, 6:00 p.m. and 8:00 a.m. on Saturday, and at any time on Sunday (i.e., construction is allowed Monday through Friday between 7:00 a.m. to 9:00 p.m.; and Saturdays and National Holidays between 8:00 a.m. to 6:00 p.m.). In general, the City’s Department of Building and Safety enforces Noise Ordinance provisions relative to equipment and the Los Angeles Police Department (LAPD) enforces provisions relative to noise generated by people.

LAMC Section 113.01 prohibits collecting or disposing of rubbish or garbage, operating any refuse disposal truck, or collecting, loading, picking up, transferring, unloading, dumping, discarding, or disposing of any rubbish or garbage, as such terms are defined in LAMC Section 66.00, within 200 feet of any residential building between the hours of 9:00 p.m. and 6:00 a.m. of the following day, unless a permit therefore has been duly obtained beforehand from the Board of Police Commissioners.

LAMC Section 114.03 prohibits the loading or unloading of any vehicle, operation of any dollies, carts, forklifts, or other wheeled equipment, which causes any impulsive sound, raucous or unnecessary noise within 200 feet of any residence between 10:00 PM and 7:00 AM.

LAMC Section 91.1206 establishes noise insulation performance standards to protect persons within new hotels, motels, dormitories, residential care facilities, apartment houses, dwellings, private schools, and places of worship from the effects of excessive noise, including but not limited to, hearing loss or impairment and interference with speech and sleep. According to Subsection 91.1206.14.1, these structures shall be designed to prevent the intrusion of exterior noise beyond prescribed levels when located in noise critical areas, such as proximity to highways, country roads, city streets, railroads, airports, and commercial or industrial areas. Proper design shall include, but shall not be limited to, orientation of the structure, setbacks, shielding, and sound insulation of the building itself. Specifically, Subsection 91.1206.14.2 limits interior noise levels attributable to exterior sources to 45 dBA Ldn or CNEL in any habitable room. Worst-case noise levels, either existing or future, are to be used as the basis for determining compliance with this requirement. Future noise levels are to be predicted for a period of at least ten years from the time of building permit application. Furthermore, according to Subsection 91.1206.14.3, structures identified under

---

14 Los Angeles Municipal Code Chapter XI-Noise Regulation (Section 112.05).
Subsection 91.1206.1 that are exposed to airport noise greater than 60 dBA \(L_{dn}\) or CNEL, shall require an acoustical analysis showing that the proposed design will achieve the allowable interior noise level.

Section 91.1207.14.2 prohibits interior noise levels attributable to exterior sources from exceeding 45 dBA in any habitable room. The noise metric shall be either the day-night average sound level \(L_{dn}\) or the CNEL, consistent with the noise element of the local general plan.

City of Los Angeles General Plan Noise Element. The Noise Element of the City’s General Plan policies include the CNEL guidelines for land use compatibility as shown in Table 8, Guidelines for Noise Compatible Land Use (CNEL), and includes a number of goals, objectives, and policies for land use planning purposes. The overall purpose of the Noise Element is to guide policymakers in making land use determinations and in preparing noise ordinances that would limit exposure of citizens to excessive noise levels. The following policies and objectives from the Noise Element apply to the Project.

Objective 2: Non-Airport. Reduce or eliminate non-airport related intrusive noise, especially relative to noise sensitive uses.

Policy 2.2: Enforce and/or implement applicable city, state, and federal regulations intended to mitigate proposed noise producing activities, reduce intrusive noise and alleviate noise that is deemed a public nuisance.

The Noise Element of the City’s General Plan policies include the CNEL guidelines for land use compatibility, as shown in Table 8. The Noise Element also addresses noise mitigation regulations, strategies, and programs, and delineates the authority of federal, State, and City bodies in regulating automotive, rail, aircraft, and nuisance noise. The Noise Element does not include any mandatory standards for land use planning or quantitative thresholds for construction or operational groundborne vibration.

1. Specified land use is satisfactory, based upon the assumption that any buildings involved are of normal conventional construction without any special noise insulation requirements.
2. New construction or development should be undertaken only after a detailed analysis of the noise reduction requirements is made and needed noise insulation features included in the design. Conventional construction, but with closed windows and fresh air supply systems or air conditioning will normally suffice.
3. New construction or development should generally be discouraged. If new construction or development does proceed, a detailed analysis of the noise reduction requirements must be made and needed noise insulation features included in the design.
4. New construction or development should generally not be undertaken.

Source: Los Angeles 1999
4.0 NOISE & VIBRATION ANALYSIS

4.1 THRESHOLDS OF SIGNIFICANCE

The impacts of the Ordinance related to noise and vibration would be considered significant if they would exceed any of the following Thresholds of Significance, in accordance with Appendix G of the California Environmental Quality Act (CEQA) Guidelines:

- Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the Project Site in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies;

- Generation of excessive ground-borne vibration or ground-borne noise levels; and

- For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the Project expose people residing or working in the Project area to excessive noise levels.

4.2 METHODOLOGY

Although not regulated by the Ordinance, well abandonment is a reasonably foreseeable outcome for many of the wells currently operating in the City, although as stated previously, no specific timeline for abandonment currently exists and the Ordinance does not include any regulations related to the timing of the abandonment of oil wells. As such, for purposes of this analysis, there are two distinct phases that would have the potential to change ambient noise levels at locations in proximity to oil and gas wells throughout the City: 1) Short-term and temporary abandonment related activities, and 2) Long-term changes to noise levels attributable to the cessation of oil and gas production and operations.

Noise levels associated with short-term and temporary abandonment related activities were calculated using the FHWA Roadway Construction Noise Model (RCNM). Because these noise levels would be short-term and temporary and most closely resemble construction activities, they have been compared to the construction noise level standards identified in the City’s Noise Ordinance (see LAMC Sections 112.05 and 41.40). Long-term changes to noise levels attributable to the cessation of oil and gas production and operations have been characterized quantitatively and qualitatively and have been compared to the City’s Noise Ordinance and Noise Element as appropriate.
4.3 IMPACT ANALYSIS

Impact NOI-1  Would the project result in generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies? (Less than Significant With Mitigation).

Short-Term and Temporary Noise

The closure of oil and gas wells entails plugging the wells in place in accordance with California Statutes and Regulations and all other applicable requirements as overseen by CalGEM. The process of well abandonment will be determined on a case-by-case basis under the regulatory supervision of CalGEM and the LAFD and will depend on individual site conditions such as type and depth of well. However, for the purposes of this environmental analysis, several generalized assumptions have been made based upon standard industry practice, existing regulations governing well abandonment, and case studies. While plugging and abandonment varies by well, there is a consistent set of procedures that are followed. Generally, the drill site’s existing drilling or maintenance rig will be used to abandon the well and remove equipment from the well. Well equipment will be removed from the site by truck. Cement trucks will also arrive onsite to fill the well at various depths over a span of several days. An operator may use in excess of 2,500 cubic feet of cement for one abandonment. The process entails removing equipment and filling the well with cement at different phases in order to ensure that it is safe to abandon the well at varying depths. At the end of each work day, the well site is closed and the rig is shut down in order to resume operations the following work day. See Section 1.2, Project Description, for the anticipated steps of well abandonment.

For purposes of estimating potential noise and vibration levels associated with abandonment activities, it is assumed each well abandonment would last approximately two weeks (i.e., 10 workdays), and on-site equipment would include one workover rig, one cement pump truck, one welder, and one tractor/loader/backhoe. This analysis conservatively assumes that all pieces of equipment would operate concurrently, presenting a worst-case impact scenario.

FHWA’s RCNM has compiled data regarding the noise-generating characteristics of specific types of construction equipment and typical construction activities. With the use of the RCNM, as detailed in Appendix B to this report, the short-term and temporary noise levels associated with abandonment activities are presented in Table 9, Temporary Noise Levels During Well Abandonment - Unmitigated.

16 When a drilling or maintenance rig is not on the well site, a rig will need to be brought to the site to complete the abandonment process.
As shown in Table 9, noise levels were estimated at distances of up to 50 feet, 75 feet and 100 feet to characterize potential noise levels that may be experienced at sensitive receptors located in proximity to oil and gas wells throughout the City. Noise levels would diminish notably with distance from the site at a rate of 6 dB(A) per doubling of distance (noise from stationary or point sources is reduced by about 6 dB(A) for every doubling of distance at acoustically hard locations). For example, a noise level of 86 dB(A) Leq measured at 50 feet from the noise source to the receptor would decline to 80 dB(A) Leq at 100 feet from the source to the receptor and fall by another 6 dB(A) Leq to 74 dB(A) Leq at 200 feet from the source to the receptor. These noise attenuation rates assume a flat and unobstructed distance between the noise generator and the receptor. Intervening structures and vegetation would further attenuate (reduce) the noise. Furthermore, it should be noted that increases in noise levels at sensitive receptors during abandonment would be intermittent and temporary and would not generate continuously high noise levels.

*Source: Impact Sciences, Inc., September 2022. See Appendix B to this report.*

Short-term and temporary impacts would be potentially significant if, as indicated in LAMC Section 112.05, noise from construction equipment within 500 feet of a residential zone exceeds 75 A-weighted decibels (dBA) at a distance of 50 feet from the noise source. Although not required in the LAMC, this analysis also applies this LAMC standard for non-residentially zoned sensitive receptors located in proximity to oil and gas wells throughout the City. It should also be noted that the LAMC noise limitation does not apply where compliance is technically infeasible. Technically infeasible means that the above noise limitation cannot be complied with despite the use of mufflers, shields, sound barriers and/or any other noise reduction device or techniques during the operation of the equipment. As shown in Table 9, the estimated unmitigated temporary noise levels could exceed the 75 dBA noise standard at distances of up to 50 feet from the source, and unmitigated noise levels would not exceed the 75 dBA noise standard at distances of up to 75 feet and 100 feet from the source. As noise levels would diminish with distance from the source, unmitigated noise levels at distances beyond 100 feet from the source would not have the potential to exceed the noise...
standard. Nevertheless, as the estimated unmitigated temporary noise levels could exceed the 75 dBA noise standard at distances of up to 50 feet from the source, this impact is considered potentially significant.

Mitigation Measures

MM NOI-1: Where well abandonment activities occur within 50 feet of the following sensitive receptors: schools, day cares, elder care facilities, adult residential facilities, parks, hospitals, or residences, flexible sound control curtains shall be erected between the noise-producing equipment and the sensitive receptors, blocking the line-of-sight between the sources and receptors. The sound control curtain materials shall meet a minimum Sound Transmission Class (STC) 20 rating, capable of reducing equipment noise by at least 5 dBA.

Level of Significance After Mitigation

The use of flexible sound control curtains, as required in Mitigation Measure NOI-1, would be feasible and effective at reducing short-term and temporary noise levels at sensitive receptors located within 50 feet of well abandonment activities. The STC-20 rating identified in Mitigation Measure NOI-1 requires the sound control curtain material to have a transmission loss (TL) value of 20 dB. TL is defined as the loss in sound energy, expressed in decibels, as sound passes through a barrier or a wall.\(^{17}\) According to FHWA Noise Barrier Design Handbook, the design feasibility of a sound barrier that reduces noise by 5 dBA is considered “simple” and a reduction of up to 10 dBA as “attainable.”\(^ {18}\) Thus, the data suggests that Mitigation Measure NOI-1 could reduce noise levels by up to 10 to 20 dBA. However, this analysis conservatively assumes that a 5 dBA reduction would be achieved with the implementation of Mitigation Measure NOI-1. As shown in Table 10, Temporary Noise Levels During Well Abandonment - Mitigated, Mitigation Measure NOI-1 would ensure temporary noise levels would not exceed the LAMC standard of 75 dBA at 50 feet from the source.

Other noise best practices would be implemented during the abandonment process. These best practices would also help to reduce temporary noise levels in accordance with LAMC Section 112.05. For example, abandonment activities would be scheduled so as to avoid operating several pieces of equipment simultaneously (as feasible), which causes high noise levels. Further, noise and groundborne vibration activities whose specific location on or near the site are flexible (e.g., stationary equipment and truck idling) will be conducted as far as possible from the nearest noise- and vibration-sensitive land uses. However, given the fluid dynamics likely to occur during the abandonment processes, this analysis conservatively does not take any quantified reduction associated with these techniques. Additionally, all abandonment

\(^{18}\) FHWA Noise Barrier Design Handbook, Table 4, July 14, 2011.
activities that occur as a result of the Ordinance would be conducted in accordance with LAMC Section 41.40, which prohibits construction between the hours of 9:00 p.m. and 7:00 a.m. Monday through Friday, 6:00 p.m. and 8:00 a.m. on Saturday, and at any time on Sunday (i.e., construction is allowed Monday through Friday between 7:00 a.m. to 9:00 p.m.; and Saturdays and National Holidays between 8:00 a.m. to 6:00 p.m.). Thus, all activities generating temporary noise levels would be limited to the less noise-sensitive daytime hours. Based on these reasons, and with the implementation of Mitigation Measure NOI-1, the Ordinance would not result in the generation of a substantial temporary increase in ambient noise levels in excess of standards established in the local general plan or noise ordinance. As such, temporary noise impacts would be less than significant.

Long-Term Noise

As discussed previously, existing oil and gas well operations contribute to the ambient noise levels at receptors in proximity to active wells and throughout the City as a whole. The types of noise associated with oil and gas operations can be complex in nature, due to a wide variety of sources. Some of these noises are intermittent, some are continuous, and many vary in their intensity. Certain sources, such as compressor stations, produce low frequency noise (LFN), which is typically heard as a low rumble. There are also numerous source-dependent and subjective factors that may influence health outcomes, such as noise sensitivity and noise reduction technologies employed at specific locations. As shown previously in Table 3, average noise levels from oil and gas production activities range from approximately 58 dBA to 90 dBA, depending on the activity and setback distances. In addition to these noise sources, other existing noise sources associated with well operations throughout the City include operator worker trips (i.e., motor vehicle noise) to and from well locations, and well maintenance related activities (i.e., fire clearance per LAFD and operations maintenance/inspections per CalGEM and other agency requirements). Upon full implementation of the Ordinance, noise sources associated with oil and gas production would be removed within the City, and long-term noise levels would likely be decreased compared to existing noise levels.
associated with oil and gas production. As such, the Ordinance would not result in the generation of a substantial permanent increase in ambient noise levels in excess of standards established in the local general plan or noise ordinance, and long-term noise impacts would be less than significant.

Impact NOI-2  Would the project result in the generation of excessive groundborne vibration or groundborne noise levels? (Less than Significant).

Similar to the short-term and temporary noise discussion provided above, activities associated with well abandonment also have the potential to generate short-term and temporary groundborne vibration levels at sensitive receptors located in proximity to the wells. Based on the parameters described previously and guidance from the FTA’s Transit Noise and Vibration Impact Assessment Manual, groundborne vibration levels associated with abandonment activities are presented in Table 11, Temporary Vibration Levels During Well Abandonment. As shown in Table 11, groundborne vibration levels were estimated at distances of up to 50 feet, 75 feet and 100 feet to characterize potential vibration levels that may be experienced at sensitive receptors located in proximity to oil and gas wells throughout the City. Table 11 illustrates that short-term and temporary vibration levels would not have the potential to exceed Caltrans’ standards for building damage (PPV) or the FTA’s standards for human annoyance (VdB). As such, the Ordinance would not result in the generation of excessive groundborne vibration levels, and these impacts would be less than significant.

aThe vibration standards applied are based on the FTA and Caltrans standards provided previously in Tables 5 and 6 herein. Source: Impact Sciences, Inc., September 2022. See Appendix B to this report.

Impact NOI-3 For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the Project expose people residing or working in the Project area to excessive noise levels? (No Impact).

Three airports are located within the City of Los Angeles: two public and one general aviation. Respectively, they are: Los Angeles International (LAX) and Van Nuys, and Whiteman Airport. There are three inactive plugged wells located within one mile of LAX. As these wells are plugged (i.e., no oil and gas extraction occurring), there would be no changes to the existing conditions at these locations. Thus, the Ordinance would not expose people residing or working in the area of oil wells to excessive noise levels associated with a private airstrip or public use airport. No impact would occur.

MITIGATION & MONITORING PROGRAM

A. INTRODUCTION

This Mitigation and Monitoring Program (“MMP”) has been prepared pursuant to Public Resources Code Section 21081.6, which requires a Lead Agency to adopt a “reporting or monitoring program for changes to the project or conditions of project approval, adopted in order to mitigate or avoid significant effects on the environment.” In addition, Section 15097(a) of the State CEQA Guidelines requires that a public agency adopt a program for monitoring or reporting mitigation measures and project revisions, which it has required to mitigate or avoid significant environmental effects. This MMP has been prepared in compliance with the requirements of CEQA, Public Resources Code Section 21081.6 and Section 15097 of the CEQA Guidelines.

The City of Los Angeles is the Lead Agency for the Project and therefore is responsible for administering and implementing the MMP. A public agency may delegate reporting or monitoring responsibilities to another public agency or to a private entity that accepts the delegation; however, until mitigation measures have been completed, the lead agency remains responsible for ensuring that implementation of the mitigation measures occurs in accordance with the program.

An Initial Study (IS) / Mitigated Negative Declaration (MND) has been prepared to address the potential environmental impacts of the Project. The evaluation of the Project’s impacts takes into consideration project design features and identifies mitigation measures to avoid or reduce potentially significant environmental impacts. This MMP is designed to monitor implementation of the mitigation measures identified for the Project.

B. ORGANIZATION

As shown on the following pages, each required mitigation measure for the Project is listed and categorized by impact area, with an accompanying identification of the following:

- **The Implementing Agency:** Implementing agency may include the Department of City Planning (DCP), Los Angeles Department of Building and Safety, Los Angeles
Fire Department and/or City Council.

- **Enforcement Agency and Monitoring Agency**: The agency or agencies that will monitor the measure and ensure that it is implemented in accordance with this MMP;

- **Monitoring Phase/Monitoring Action**: The criteria that would determine when the measure has been accomplished and/or the monitoring actions to be undertaken to ensure the measure is implemented.

All agencies and departments are in the City of Los Angeles, unless otherwise noted. The implementing, enforcement and monitoring agencies, have authority to determine the applicability and compliance of all mitigation measures in their reasonable discretion.

**C. PROGRAM MODIFICATION**

The MMP describes the procedures for the implementation of the mitigation measures to be adopted for the Project as identified in the Mitigated Negative Declaration. The MMP for the Project will be in place through the lifetime of the ordinance (approximately 20 years) or until all well drilling in the City has ceased, whichever is first. DCP and other City Departments (e.g., Department of Building and Safety) shall be responsible for administering the MMP activities or delegating them to staff, other City departments (e.g., Department of Building and Safety [DBS], Department of Public Works [DPW], etc.), consultants, or contractors. The City may choose to designate one or more environmental monitor(s) (e.g. City building inspector, project contractor, certified professionals, etc., depending on the requirements of the mitigation measures).

In implementing mitigation measures, the standard shall be waived by the City Planning Director or his or her designee where the mitigation measure is found based on substantial evidence to be no longer necessary for the purpose of which it was adopted (e.g., another regulatory agency requires an equal or more effective requirement, the City has adopted equally or more effective regulations that are applicable; or the particulars of the subsequent action makes the standard unnecessary to address the impact intended to be mitigated; new technology has made the standard unnecessary to mitigate the impact). Similarly, as this is a long-term Project and technology and circumstances may change over the next 20 years that may make the mitigation measures in this MMP unnecessary or impossible, for all mitigation measures in the MMP, mitigation measures
may be waived or not enforced if consistent with the requirements of CEQA (statute, guidelines and case law).

D. MITIGATION MONITORING PROGRAM

Hazards and Hazardous Materials

Mitigation Measure

HAZ-1: For well sites in which the abandonment process requires grading and are:

- Located on or within 500 feet of a Hazardous Materials site listed in any of the following databases:

  State Water Resources Control Board GeoTracker (refer to https://geotracker.waterboards.ca.gov);

  DTSC EnviroStor (refer to https://www.envirostor.dtsc.ca.gov/public);

  DTSC Hazardous Waste Tracking System (refer to https://hwts.dtsc.ca.gov);

  LAFD Certified Unified Program Agency (refer to the active, inactive, and historical inventory lists at https://www.lafd.org/fire-prevention/cupa/public-records);

  Los Angeles County Fire Department Health Hazardous Materials Division (refer to the active and inactive facilities, site mitigation, and California Accidental Release Prevention inventory lists at https://fire.lacounty.gov/public-records-requests);

  SCAQMD Facility Information Detail (refer to https://xappprod.aqmd.gov/find); or

- Located on or within 500 feet of a Hazardous Materials site designated as a Resource Conservation and Recovery Act (RCRA) Small Quantity Generator or Large Quantity Generator (refer to the U.S. EPA Envirofacts database at https://enviro.epa.gov/index.html);
And:

The site has not been previously remediating to the satisfaction of the relevant regulatory agency/agencies for any contamination associated with the above uses or site conditions.

Then a Phase I Environmental Site Assessment shall be prepared by a Qualified Environmental Professional in accordance with State standards/guidelines and current professional standards, including the American Society for Testing and Materials’ (ASTM) Standard Practice for Environmental Site Assessments, to evaluate whether the site, or the surrounding area, is contaminated with hazardous substances from any past or current land uses, including contamination related to the storage, transport, generation, or disposal of toxic or Hazardous Waste or materials.

If the Phase I identifies a Recognized Environmental Condition (REC) and/or if recommended in the Phase I, a Phase II Environmental Site Assessment shall also be prepared by a Qualified Environmental Professional. The Phase I and/or Phase II Environmental Site Assessment(s) shall be maintained pursuant to appropriate proof of compliance and made available for review and inclusion in the administrative record by the appropriate regulatory agency, such as the State Water Resources Control Board, the State Department of Toxic Substances Control, or the LAFD Hazard Mitigation Program. Any remediation plan recommended in the Phase II Environmental Site Assessment or by the appropriate regulatory agency to ensure the abandonment process does not exacerbate existing identified hazardous conditions shall be implemented and, if required, a No Further Action letter, or equivalent, shall be issued by the appropriate regulatory agency prior to issuance of any permit from LADBS, unless the regulating agency determines that remedial action can be implemented in conjunction with excavation and/or grading. If oversight or approval by a regulatory agency is not required, the Qualified Environmental Professional shall provide written verification of compliance with and completion of the remediation plan, such that the site meets the applicable standards for the proposed use, which shall be
maintained pursuant to appropriate proof of compliance requirements.

**Implementing Agency:** DCP

**Enforcement Agency:** Los Angeles Fire Department

**Monitoring Phase/Monitoring Actions:** as oil wells are proposed for abandonment

**Action Indicating Compliance:** Preparation of Phase I Environmental Site Assessment, investigation by REA and remediation; further studies and remediation as necessary by qualified contractors

### Noise

**Mitigation Measure**

**MM NOI-1:** Where well abandonment activities occur within 50 feet of the following sensitive receptors: schools, day cares, elder care facilities, adult residential facilities, parks, and hospitals, or residences, flexible sound control curtains shall be erected between the noise-producing equipment and the sensitive receptors, blocking the line-of-sight between the sources and receptors. The sound control curtain materials shall meet a minimum Sound Transmission Class (STC) 20 rating, capable of reducing equipment noise by at least 5 dBA.

**Implementing Agency:** DCP

**Enforcement Agency:** Department of Building and Safety / Los Angeles Fire Department

**Monitoring Phase/Monitoring Actions:** as oil wells are proposed for abandonment

**Action Indicating Compliance:** Inclusion in grading permit specifications
